#### ABSTRACT

This document is the second in a series of biannual surveys. It is a collection of project descriptions, each of which includes the following: (a) project title; (b) statement of whether the project is in progress or completed; (c) affiliated institute; (d) name of project and investigation leader; (e) personnel; (f) time schedule; (g) source of finance; (h) keywords, taken from the EUDISED Thesaurus or the Thesaurus of ERIC Descriptors; (i) background, aims, and problem; (j) scope; (k) methods; (l) main findings; and (m) bibliographic information. The projects are grouped under 13 broad subject categories: (a) early childhood education, (b) social studies, (c) handicapped, (d) languages and linguistics, (e) reading and communication skills, (f) physical education, (g) vocational education, (h) mathematics, (i) educational management, (j) adult education, (k) teacher education, (l) higher education, and (m) miscellaneous studies. #### INTRODUCTION

The present volume of the EDUCATIONAL RESEARCH IN SWEDEN is the second one in a serial of biannual surveys. It is the result of an international project, undertaken by member governments of the C uncil of Europe. The basis is a questionnaire, elaborated by the Council of Europe ad hoc Committee for Educational Research.

The volume has been prepared by the National Library for Fsychology and Education in co-operation with the National Board of Education and the Swedish Council for Social Science Research. The collection of data was completed on September 1, 1974.

In many cases the findings of the projects are of a preliminary character and cannot be expected to provide definite conclusions for practical work in an education system. The research results usually have to be followed up through educational development work in order to be practically applicable.

The projects described in the survey are grouped into broad subject categories. (See Contents.)

The subject indexes are elaborated from the EUDISED Thesaurus. 1)
In those cases where the EUDISED Thesaurus did not have the adequate terms, the Thesaurus of FRIC Descriptors had to be used. Such terms are marked with an \*). There is also an index of researchers as well as a list of institutes.

Mr. Olle Överby, the National Board of Education, is the editor.

Additional copies can be obtained as far as the supply admits, from

The National Library for Psychology and Education P.O. Box 23099 S-104 35 Stockholm 23.

10 Scope	

Three types of program were tried out:

1) Instructions for games, activities and discussion themes which aimed at increasing the child's insight into his own and other people's motives, needs and reaction tendencies in which a combination of cognitive understanding and practical application was strived for.

2) Cooperative training in small groups in which the children got the experience of making common decisions, to share tasks and working toward a common goal. Doll

play model situations were used for teacher-child discussions.

3) Conflict situations enacted in doll play in small groups of children. Motives and consequences of common social conflicts, such as teasing, rejection, aggression, sibling rivalry were discussed.

In all methods the child's own initiative and creative participation was

stressed.

#### 12 Main findings

The pre-school teachers experienced the instructions as practically useful and in line with the general goal of Swedish pre-school education. Measurement of effect showed a general increase in cognitive insight into social relations. Attitude changes were not registered, however.

Observations of group cooperation showed that in 10 out of 18 groups cooperative activities had increased to a substantial amount.

Great variation was noticed between different teachers. Discussions and incerviews with the teachers showed that the methods had been applied in different ways. This led to a different line of approach of the project work. An analysis was made of the teachers' opportunities to influence the child's social and emotional development by use of spontaneous situations in a conscious way. Observations of the daily activities in day care institutions and part-time pre-schools have been made in order to work out methods that emanate from the child's "natural" activity and social situation. The goals and attitudes of the teacher has been investigated in group discussions and separate interviews.

9 Background, aims and problem

Early childhood is a period of rapid development and great receptivity of environmental influence. Lack of proper stimulation during the early years can lead to last defects but on the other hand is this a favourable time for preventive action. Although this is generally understood, the educational consequences have not yet been taken. Society's efforts to help handicapped children are concentrated on school age. Special education in Sweden is a well developed and differentiated system of remedial action. But similar arrangements for preschool children are largely lacking. Only for children with very serious handicaps exist organised educational-social-medical programmes reaching a small proportion of the children who need help. In many countries there has been great interest in recent years in "compensatory pre-school education", mainly directed to socio-culturally deprived children. For different reasons similar experiments have not been launched in Sweden, but the Pre-School Commission has discussed the problems of children with special needs and has proposed early identification of such children and recommended that special educational measures

are taken for them. Early intervention is also in agreement with the trend 10 Scope towards a more flexible view of school-readiness problems.

9 Background, aims and problem

Background: The Swedish debate concerning the establishment of a compulsory preschool or, alternatively, lowering of the age of compulsory school entrance from 7 to 6 years.

Aims: To study the effect of an individually adapted reading and writing instruction for six-year-old preschool children as compared to ordinary preschool work without reading or writing instruction. This effect is studied with regard to the development of the children's reading and writing skills up to the end of grade 3 of the comprehensive school. It is expected that the results of this study will contribute to the forming of a basis for decisions concerning instruction at the preschool level in the future.

10 Scope

In all, the study comprises about 550 children, 320 of whom are preschool children.

The experimental control group method is used in the study. Reading and writing instruction is given to 16 groups of 10 six-year-olds each (experimental group), recruited from four of the larger preschools in Linköping (a city with a little nore than 100 000 inhabitants), while the corresponding number of six-year-olds in parallell groups at the same preschools (control group 1) are given no such instruction. The effect is evaluated through standardised reading and writing tests at the end of the preschool year and when the children have finished grades 1, 2 and 3 respectively of the comprehensive school. The instructional effect in the experimental group is also compared with the results of regular beginners' instruction in grade 1 of the comprehensive school, by means of the same tests administered to 8 classes in grade 1 (control group 2). The reading and writing instruction in the experimental group is given by trained and experienced primary school teachers. The children are taught in groups of ten for one full hour a day, which is equivalent to 7 lessons per week. (This should be compared to the 11 lessons per week devoted to the subject Swedish in grade 1.) The Instruction is adapted to the individual abilities of the children and is progressing - especially during the first term - at a slower rate than is usual in the beginners' instruction in grade 1 of the comprehensive school.

#### 12 Main findings

The experimental group and the control group 1 children were tested at the end of grade 1 (in 1973) and grade 2 (in 1974) of the comprehensive school. Preliminary analyses of the test data indicate that the children given reading instruction in the preschool (Experimental group) surpass the control children at the corresponding intelligence level in terms of reading ability. It is particularly noteworthy that the proportion of very poor readers at the end of grade 1 is smaller among these children who received reading instruction in the preschool than it should normally be expected to be after one year of schooling. The proportion of children judged to be needing remedial treatment (reading clinic etc.) is also clearly smaller in the experimental group than in the control group.

Practically all parents of the experimental group children had a very positive attitude towards the reading and writing instruction given at the preschool level.

9 Background, aims and problem

At the Department of Pediatrics at the Karolinska Hospital a number of children have been studied from medical and psychological points of view, from birth during the preschools years and all through the school years. These data are complemented by investigations from a pedagogical point of view, the children's adjustment to the school environment, their school achievement and possible learning difficulties and adjustment problems.

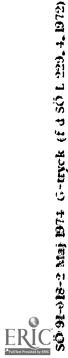

10 Scope

212 children born in Solna, as well as all other whildren in these children's clases.

ř

10 Scope

212 children born in Solna, as well as all other whildren in these children's clases.

Individual tests: Intelligence tests and a number of projective tests: Machover, Sentence completion, Blacky Picture Test, Rorschach, Rosenzweig.

<u>Grouptests</u>: Reading test, Arithemetical test, Intelligence test, Achievement tests and Concentration test. Attitude schedules and ratings by peers. Ratings by teachers.

#### 12 Main findings

The data collection is intended to be continued until the children reach the age of 20 years. Analysis of data from extreme groups have resulted in two licentiate-thesis.

Other problems are under study: "Mental development related to social factors" and "Social attractiveness related to pupils' achievement and personality".

14 A

-018-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

Project area I: Descriptions of different educational situations for preschool children, especially for 5-6-year-olds, have been worked out by the project. This work started in spring 1971. Evaluations and revisions were made in 1972/73 and 1973/74. The descriptions have finally been edited and put together in the book "Växa i förskolan - uppslag för utveckling", published by the Utbildningsförlaget in Stockholm in July 1974. The evaluation comprises teachers' assessments, teacher questionnaires and pupil tests. Project area II: Different forms of collaboration between preschool and grade 1, primary school, have been developed and tried out. The range and activities of the collaboration have varied, depending on, for example, the distances between the buildings, the teachers' planning and the structure of the groups of children.

The evaluation comprises diaries, questionnaires and assessments from the teachers: tests and interviews with the children; frequent discussions with the teachers.

Project area III: The collection of data for project areas I and II will be used partly for analysis of different groups of children in the experimental population. At present a

#### 12 Main findings

special study is planned.

Project area I: The book "Växa i förskolan - uppslag för utveckling" is intended to be a teacher aid to be used by all persons working among preschoolchildren, especially 5-6-year-olds, and among children starting the compulsory school. The book is also intended to provide a concrete basis for the collaboration between preschool and primary school providing material for planning and information.

The results from the teacher assessments and questionnaire answers indicate that the new preschool curriculum is a valuable aid for the preschool teacher. It has been a fruitful contribution to the stimulation of the children and has benefitted the development of the children. According to the teachers, they now work more in small groups or individually. Both the children and the teachers have initiated activities to the same extent.

<u>Project area II</u>: During the last school year (1973/74) the collaboration resulted in many different models. Each model is decided by factors such as the distance between buildings, the scheduled timetable, the number of pupils and the teachers' planning. An inventory has been made of different activities carried out as part of the collaboration.

Cooperation between nursery school and primary school

9 Background, aims and problem

The introduction of a general nursery school for 6 year old children have put in focus the interest of the relation between nursery and primary school. Important questions are: What are the relations between nursery and primary school when looking at goals and ways of working, is it possible to narrow the ways of working of the two types of schools, what kind of cooperation is possible and eligible, aiming at for instance making school-start smoother.

The aim is, through a number of sub-projects, partly to give a whole picture of the problem area, partly to formulate concrete suggestions for a continued development and research, education and further training for teachers in nursery and primary schools, and to find ways of cooperation between them.

10 Scope

J.J-018-2 Maj 1974 G-tryck (f d SÖ L 229.4, 1972)

The project consists of five sub-projects: No. 1 tries to give a picture of ways of cooperation already existing. Method: A questionnaire is sent to all municipalities in the country.

No. 2 consists of analysis of research projects terminated and in progress, in the field of cooperation.

No. 3 is a longitudinal study of explorative character, aiming at describing a group of children and their development during the time of school-start. Methods: Observations and interviews.

No. 4 consists of analysis and synthesis of different theories of development, aiming at formulating practical conclusions for psychological and educational work with children in the ages of interest.

No. 5 aims at trying to show the attitudes of teachers in nursery and primary schools concerning their work and how they look at the relation between nursery and primary schools. Method: Interviews.

No. 6 Reporting and analysis of the earlier mentioned subprojects.

9 Background, aims and problem

The project aims at an analysis of the research concerning the following areas: Upbringing in the family. Upbringing in the neighbourhood. Care for children outside their homes. Structured educational programs. Educational programs for children with handicaps or special needs. Cooperation between preschool and school.

10 Scope

About 200 research reports are reviewed.

9 Background, aims and problem

The purpose of the bwedish comprehensive school is to stimulate the development of both knowledge and skills as well as social skills. The social development is in the curricula considered as important as the intellectual development. However, by tradition and training most teachers stress the intellectual side of the personality. They also feel it difficult to find methods to stimulate the social development. In schools today there also exist a lot of barriers that prevent an effective social training.

The purpose of the project is to develop and test methods based on social psychological and pedagogical theory and research which facilitate the attainment of these social goals. In order to do that we need methods that change buth the teacher and the student role.

A special substudy is studying the role of school in sex role socialization (see special description by Wernersson).

10 Scope

From fall 1974 activities are carried out in school in four headmaster districts in Gothenburg. In addition some smaller studies in schools outside the Sothenburg area.

10 Scope

From fall 1974 activities are carried out in school in four headmaster districts in Gothenburg. In addition some smaller studies in schools outside the Gothenburg area.

m.

The main activities are to find strategies for working through the teachers in the schools. It takes a great deal of work to stimulate them and together with them develop methods which give the students opportunity to take on responsibility, cooperate, show consideration, tolerance and judgment in the daily school life and give them opportunity to work up the experiences cognitively. Among others the following methods are used:

older students become tutors for younger ones

older students or older classes adopt younger ones and/or cooperate with them cooperation between different teachers and subjects.

The methods aim to give the student more of an adult role, more of responsibility in school. To get the teachers to change their own role, we meet them regularly in groups and discuss their situation, give them some knowledge in social psychology and so on.

Members of the project spend a lot of time in the schools, stimulating the teachers and registrating the activities.

Background: The traditional patterns of sex differentiation have proved to be very stable. Education is often seen as an effective means for changing these patterns. Equal rights and oppotunities to education are not, per se, leading to significant change as long as vital parts of society are profiting from the sex differentiation (e g women as labour reserve the mobility of the nuclear family). Problem and aims: In this situation the achool has been given the task to work actively for sex equality. The aim of the project is to study the conditions for and actual performance of this task. This aim is tripartite: 1. To study life at school from different aspects in order to understand the school's role in the forming of the pupils sex roles. 2. To relate the sex roles in the school to those of the surrounding society and analyze the relative importance of the school in the socialization of these roles. 3. To describe and analyze the histo-rical development preseding the present positions taken concerning the school's role in the changing of sex roles.

10 Scope

An extensive study including 500 pupils in each of grades 4 and 7. An intesive study including 2 classes in each of grades 1,4 and 7.

upbringing.

The project is a longitudinal study of the influence of the home environment on children's adjustment and development. The children were tested as infants with the Griffith Baby Scale. In a follow-up at the age of four, their cognitive, verbal and social development were studied, together with different aspects of their home environments. The children are now about twelve years old and a new follow-up is being performed. The aim of this is to study how different variables in the children's home environment are related to different aspects of their development. The children are studied in the following variables: Cognitive development, verbal development, school achievements, self-esteem, adjustment to friends, to school, to home and their leisure time activities. The home environments are studied in the following variables: Family background, siblings, family harmony, up-bringing pattern and the parents' school interest.

#### 10 Scope

The project includes three sub-studies performed when the children were infants, when they were at the age of four and at the age of twelve. The

Several methods have been used in this project:

Literature studies Interviews with parents and teachers Questionnaire for parents, teachers and children Intelligence tests for children

Statistical analyses, regression and correlation analyses.

# 12 Main findings

The follow-up at the age of 12 has not yet been finished, so no results exist. The results from the previous studies can be summarized in the following way: The interaction between the child's environment and its development is very complicated. There is a mutual interaction between the child's performance in the tests and its environment, with influences in both direction. The results from the four years follow-up show that there is a direct connection between test performance and the different variables in the home environment. The size of the correlations varies depending on which test has been used, which variable in the environment has been measured and the age of the children. The environment variables with the highest relationships with the children's achievements were those describing the verbal athmosphere in the home.

9 Background, aims and problem

The purpose is to study the existence or nonexistence of a generation gap and its contents and young people's (in their twenties) view on and adoption of the adult role.

The generation gap is described in a model including three dimensions:

- 1. actual differences
- 2. perceived differences
- 3. emotional reactions

A main hypothesis is that a positive psychological contact decreases the existence of at least perceived differences.

10 Scope

About 4500 young people, 20 years of age, previously studied in Project YO when 14 years old, have received a mail enquête 1971. A 125 sample of young people and mothers were selected for interviews 1972. A 255 sample is followed up with another mail enquête 1974.

10 Scope	

About 4500 young people, 20 years of age, previously studied in Project YG when 14 years old, have received a mail enquète 1971. A 12% sample of young people and mothers were selected for interviews 1972. A 25% sample is followed up with another mail enquète 1974.

Mail enquètes

Interviews
Questionnaires and scales distributed in connection with the interviews
Statistical analyses of different kinds including extensive analyses
of the non-respondents.

32

# 12 Main findings

The results from the mail enquête 1971 have shown that a common generation gap - as the project has defined it - does not exist in the actual group of subjects. Only less than 10% of the respondents have relations to their parents implying an affective conflict situation.

The work continues with studies of the adult role and analyses are made of the interviews with the young people and their mothers. The results cannot be summarized shortly here.

Extensive analyses of the groups of nonrespondents have shown that they seem to affect the results to a less degree could be feared.

#### 13 Bibliographic information

Keywords Aptitude, teaching method 9 Background, aims and problem The starting point of the project is that there exists no teaching method that is best for all pubils, which implies that interactions between aptitudes and treatments can be expected. Within the project the strategy of research labelled ATI-research (Aptitude-Treatment Interactions) is thus pursued. The aim is to study such interactions for a choice of variables. 10 Scope

. - 15-2 Maj 18 5 c-1740k (f 3 SO L 229, 1, 1972)

The research is carried out as reviews of the literature and own empirical research.

In the empirical research a combination of experimental and correlational techniques is used through the study of regression of learning scores on aptitudes within groups given different treatments. In the more detailed study of the interactions the old but little used Johnson-Neyman technique has been applied.

## Main findings

Different combinations of variables have been studied within different series of experiments.

One group of variables that has been treated is verbal and figural ability and the corresponding teaching methods. Interactions have in one study been found with these variables, even though the interpretation of the interactions in the light of subsequent (not yet reported) replications seems problematic. Another treatment variable that has been studied is the size of the task in connection with the learning of English vocabulary. Also here interactions have been found although these partly seem to be due to the experimental design. Within the project the stability of ability profiles - a problem central for ATI-research - has also been studied, with the results indicating a relatively high degree of stability.

At a more general level can as one of the main results of the project be mentioned that the existence of interactions between aptitude and treatment seems well established which has profound implications for the research on teaching methods as well as for the differential psychology.

Goal, general, aims, teacher training

9 Background, aims and problem

The starting-point for this project was the need to fulfill the intentions of the Swedish Läroplan to help the student in his personality development as well as in developing ordinary subject skills. Here we felt a need to describe the intentions more explicity and concretely. The mainproblem can be said to be how to rise the consciousness of teachers and others of the primary aims of schools, that is an optimal development of all sides of the student in which the subject skills are one element. A second problem is: what kind of help do teachers need to make teaching correspond to this double aim? The project tries to produce examples on this point for different levels and subjects.

10 Scope

Completed

X In progress

Institute

abed May 1974 to reyek (fid See E 229, 4, 1972)

We are working on the one hand with theoretical analyses of litterature and of Läroplaner as well as with interviews and groupwork together with teachers to specify what is said in Läroplanen.

We are on the other hand working with teachers in circles to help them make their own decisions about what school in general and their own teaching in particular are for.

# 12 Main findings

The results of this project is hoped to be a material that can

- 1) be used when teachers and others try to rise their consciousness about teaching
- 2) be used by the teacher and his pupils when they try to arrange education so as to correspond to the above intentions
- 3) be of use to those who prepone textbooks.

9 Background, aims and problem

The background is the problems concerning the internal school activities due to the latest Swedish school-reforms. The purpose is to describe and explain the contradictions and conflicts behind the actual problems with the internal school-work (through quality-analysis of the teaching process).

The project is a sociological micro-research intended to generating hypotheses forming a ground for limited experiments.

10 Scope

Primarily two classes at the upper level of the comprehensive school in one school (teachers, pupils and their parents), secondly all four classes of the same level and two classes in another school (the same level).

ERIC

- 1. Interview with two classes in grade 7 of the comprehensive school (1972). The intervi. were made individually with the teachers and in group with the pupils (3 pupils in each group). The interviews were partially structured, tape-recorded and written in extenso (1 hour each). Collection and analysis of the material were reported in 1972.
- 2. Some fourty tape-recorded lessons on different subjects together with syncronized notes by two observers (notes primarily on non-verbal behaviour). Tape-recordings and notes were made during regular lessons in ordinary class-room settings in grade 8 of the comprehensive school with the already interviewed teachers and pupils. Data processing and analyses are now carried out. Some ten lessons are worked out (partly in the form of a drama). The main part of the work is the qualitative analysis of the (unconscious) process of socialization that can be traced to the mode of teaching and working in the class with the actual subject.

Continued below

# 40

## 12 Main findings

- 3. Structured interviews with the parents of pupuls in all six grades mainly intended to collect background data about the home and its connection with the choice of courses and subjects ("hidden streaming") and about their future educational and occupational choice.
- 4. Short structured interviews with the pupils before they left grade 9 (the last year of the comprehensive school).
- 5. Studies of the literature on the connection between school-reforms and the development and change of society in view of an international perspective.

A factor-analytic study of the Terman-Merrill intelligence test has been done. A first step was to compare the results of a factor analysis done at each age with a factor analysis done at all ages together. The results were relatively difficult to interpret. Therefore a hierarchic cluster analysis has been done too. The cluster analyses have been done on distance matrices instead of correlation matrices.

The cluster analyses were made in two steps: 1. One analysis at each age, 3 years, 5 years, 8 years and 11 years. 2. After adding the cluster scores of each individual a new cluster analysis of all ages together was made (3 years - 11 years).

## 12 Main findings

The first analysis gave three clusters (I = III = ) at age 3, four clusters (I = IV = ) at age 5 and five clusters (I = V = and I = V = 11) at ages 8 and 11:

The second analysis gave three clusters: cluster 1  $I_3+III_3+II_5$ ; cluster 2  $I_5+II_5+V_8+II_{11}$ ; cluster 3  $IV_5+I_8+II_8+III_8+I_{11}+III_{11}+V_{11}$ .

Preliminary cluster 1 has been called a motor factor, cluster 2 a mamory factor and cluster 3 a verbal factor.

9 Background, aims and problem	n	

Studies of research reports and interviews with parents, pupils and teachers have shown that the do-operation between school and home in many cases is not in accordance with the aims and guide lines given by SO (the Board of Education) in Ler 69 and further emphasized in the SIA report (SOU 1973:53).

The nurrose of the present investigation is to study the problems and the forms of co-operation between the comprehensive school and the families, to introduce new ways of communication in order to achieve true communication and a better relationship between teachers, numils and parents, and to study the effects of this co-operation.

The problems thus are: What forms of communication do we have to-day? That actions could be taken to improve the co-operation? what effects will these actions give?

10 Scope

ERIC been issued during 1973-74.

The project has concentrated on three relatively different aspects of social development and training, namely: (a) "Cooperation" (Section C); (b) "Resistance to authority and propaganda" (Section R); and (c) "World citizen responsibility" (Section W).

The general strategy of the project has been to work on parallel lines with all three variable fields (with a research assistant in charge of each one) and then to start with the construction and evaluation of measuring instruments. From some points of view, this could be said to have resulted in three, partially independent, sub-projects. If we cross-tabulate the three general goal areas (1,2,3) described above with three chosen variable fields (C,R,W), we get a problem table with nine task-cells, all of which have been dealt with in the project. Within each variable field, the most common chronological approach has been: Step-wise construction and testing of methods - Charting with the aid of observation, questionnaires and/or objective tests - Exploration of educational influences.

46

# 12 Main findings

The mapping studies of the project have in several respects given a discouraging picture of the "normal" development during the years in the comprehensive school. We do not find, for example, any strong increase in the students' evaluative ability (ability to evaluate information critically) in the higher grades. We find marked stereotypes in sex-role perception. And we find increasingly negative ideas about certain minority groups and immigrants. At the same time various experiments with specified educational influence give us reason for optimism. Systematic measures pay and give results in the desired direction. A further development of such measures is therefore recommended.

The results of the project have been presented in about fifty reports and publications. These are listed with abstracts or annotations at the end of a survey report in English: Bjerstedt, 1974. Some other summarizing reports in English are listed below.

Main aims:	
1. To map out some characteris	stic patterns of interaction, attitudes and opinions f student participation at various educational levels.
	ttitudes and opinions on the one hand and various

3. To examine some features of the innovation process when new procedures for co-planning are introduced.

10 Scope

The project included a number of sub-studies of varying scope, within three major sections of work (cf. below). The main work of the project was completed in 1972-73. A number of supplementary and summarizing publications were issued during 1973-74.

- AL 2/2

#### 11 Methods

The work of the project was divided into three major parts.

One part was concerned with school democracy on the levels of the junior and intermediate stages of the comprehensive school (section I: grades 1-6); another dealt with corresponding questions in the senior level of the comprehensive school and in the secondary school (Section II: grades 7-12); while the third part studied problems concerning study at democracy at university level, with particular attention focussed on the teacher-training sector (Sector III: above grade 12).

Main Instruments used were: questionnaires, interviews, personality tests, content analyses.

48

### 12 Main findings

In general, internal educational democracy in Sweden has made progress during the last ten years, and several of the results from the various experimental activities were positive. However, the deficiencies are still in many respects very obvious. On the basis of its various experiences, the project outlined and recommended a series of follow-up tasks.

The results of the project have been presented in about thirty reports and publications, which are listed with abstracts or annotations in a survey report in English: Bjerstedt, 1974 b. Summaries from the various sectors of the projects have also been reported in English (see Idman, 1974; Valind & Valind, 1974; and Wetterström, 1974).

BEST COPY AVAILABLE

(1) Inventory of teacher opinions by means of questionnaires.

(2) Exploratory classroom studies (observations, questionnaires, tests.)

(3) Construction and try-out of group tests.

(4) Construction and evaluation of student exercises.

The observation study employed an observation schedule designed to chart the incidence of different types of cognitive activities in teaching. -

The test analyses included various creativity instruments, personality tests etc. - Materials for training creativity were developed in three school subjects (Swedish, mathematics, and social studies) for grade 5. The effects were evaluated by means of an experimental investigation. Twenty-four classes were included; four taking exercises in Swedish, four in mathematics, four in social studies, four in all three subjects, and eight serving as controls (with test only). A comprehensive pretest battery was used at the start of the term, a period of instruction including the new exercises followed, and then a post-instruction test battery was used. Reactions from teachers and students on the various parts of the study materials were collected.

### 12 Main findings

The results from the present project have been partly product-oriented; that is, the project has produced certain tests and certain exercise materials together with systematic information about how these tests and materials have functioned when applied to Swedish school children. In addition, various developmental and relational data on creativity in school have been reported.

As a result of the training introduced by the newly constructed student exercises, clear effects in the desired directions were obtained over a broad range of evaluation measures: subject-specific tests of creativity, general creativity tests, tests of functions related to creativity, and tests of knowledge. A specific characteristic of the exercises used in this investigation was that they could be used as an integral part of the regular teaching in the various school subjects. The attitudes of students and teachers were mainly positive. Exercises of these types are seen as a natural first step towards a more creative school.

Earlier studies carried out at the	Malask damantarask to a second	

department have shown that at present the school does not manage to a sufficient degree to counteract influences that encourage prejudice. We find, for example, marked sex-role stereotypes and a tendency for attitudes towards immigrant and other minority groups to become more negative during the years in the comprehensive school. Thus, it is important for both school and society successively to augment our knowledge of the dynamics of related developmental and social psychology, of how attitudes towards that which is different and foreign develop, and of the possibilities of preventing a less desirable development by means of educational strategies.

The present project, now in a planning stage, aims primarily at (a) constructing and testing methods for studying attitudes towards equality and solidarity in areas of importance to the Swedish school; (b) mapping with the aid of such methods certain aspects of the actual development; and (c) exploring some different possibilities for actively developing more desirable attitudes and behaviors.

10 Scope

The project plans to focus its studies on the lower grades of the comprehensive school.

Investigation groups are all pupils in three cohorts (1965 in grades 3, 6, and 8) at the schools of Orebro. Each cohort consists of about 1000 children. The youngest group is the main group of the project. It left the comprehensive school in 1971.

e\_toulitaingi\_erad)

The design of the project is longitudinal and successive age groups are studied in order to give possibilities to differentiate age and generation effects. The problems are treated within the framework of psychological and methodological models which are relevant for the study of open systems, e.g. causal analyses, measurement of change, classification to homogeneous classes, over- and underachievement, decision takning. The basic information of the project, collected in total group investigations on repeated occasions, includes the following groups of variables: socio-economic background, satisfaction with school, peer relations, attitudes and values, norms, behaviors, intelligence, creativity, ability, achievements, various symptoms of maladjustment, motivations and plans in the choice of education and of vocation. The measurements are made with different types of questionnaires, tests and other group administered instruments, and ratings. In a sample of children physiological variables have been measured. In another sample the problem of social relations has been treated with interviews with parents, pupils and teachers and with observations of behavior at school.

### 12 Main findings

54

The output from the project consists of such a multitude of results that it is necessary to refer directly to the substudies for the practical results. The work so far, as well as the results, strongly indicates that the broad cross-scientific and longitudinal approach that has been undertaken has proved to be very fruitful. Many problems of current interest have been studied within this project which otherwise would have taken years of special study. Examples are the subprojects concerning school segregation and dropouts. In theory, the scope of the project is large enough to allow the study of a variety of such problems, but in practice, limited resources enforce a careful selection of problems for study. It has been shown that variables measured with uncomplicated and cheap methods during the first school years can fairly well predict later important types of behavior.

Completed

(A substudy of the Orebro project)

X in progress

2

3 institute

11 Methods

Behaviors in grades 3 and 6 have been studied with the use of a) ratings by teachers, (motor disturbance, withdrawal and lack of school motivation) b) questionnaire to the pupils (school satisfaction) and with sociometric techniques (peex relations). During the later school years data have been collected with questionnaires to the students about symptom load, self-reported delinquency and attitudes to crime, norms during adolescence and attitudes to school and the perception of the situation at school and at home. Sociometric ratings and other ratings have also been used. Data have been treated with the following methods: a) Extreme groups method. Children who in grade 3 have shown the behavior to a high degree have been studied carefully during their later time at school. b) Regression analysis, where the total material is treated and where it is possible to make effective controls and study interaction effects. c) Canonical correlations to get a picture of the power to predict adjustment in the information.

56

## 12 Main findings -

The results so far show that there is a fair stability in most of the variables. About half of the groups are no longer extreme in grade 6 when the same criteria are used. The stable children show worse adjustment during the later years at school than a normal group. The instable are on an average better than the stable, but they are also less well adjusted than the normal group. Many children have achieved a quite normal adjustment, but a greater percentage than in the normal group are maladjusted. Those children in an extreme group who have also shown other symptoms in grade 3 have in a number of cases been less well adjusted in grades 8 and 9, the prediction is improved with the addition of information. Interaction effects are investigated in further studies.

withdrawn children i vom grade 3 to 9.) Orebroprojektet, 1974.

Broman, A. Utstötta barn. (Rejected children. A follow-up study of children who were rejected from the peer group in grade 3.) Orebroprojektet, 1974.

techniques (peer relations). During the later school years dat a have been collected with questionnaires to the students about symptom load, self-reported delinquency and attitudes to crime, norms during adolescence and attitudes to school and the perception of the situation at school and at home. Sociometric ratings and other ratings have also been used. Data have been treated with the following methods: a) Extreme groups method. Children who in grade 3 have shown the behavior to a high degree have been studied carefully during their later time at school. b) Regression analysis, where the total material is treated and where it is possible to make effective controls and study interaction effects. c) Canonical correlations to get a picture of the power to predict adjustment in the information.

56

## 12 Main findings

The results so far show that there is a fair stability in most of the variables. About half of the groups are no longer extreme in grade 6 when the same criteria are used. The stable children show worse adjustment during the later years at school than a normal group. The instable are on an average better than the stable, but they are also less well adjusted than the normal group. Many children have achieved a quite normal adjustment, but a greater percentage than in the normal group are maladjusted. Those children in an extreme group who have also shown other symptoms in grade 3 have in a number of cases been less well adjusted in grades 8 and 9, the prediction is improved with the addition of information. Interaction effects are investigated in further studies.

Institute

11 Methods

Data from the Orebro project are used. Pre-studies are made on extreme groups: pupils from high SES in classes where most of the peers have high and low SES respectively as well as pupils from low SES with the majorities of peers from high and low SES.

The main analyses are performed using regression analytical techniques. An index of the social composition of the class is the independent variable. Intelligence and SES are controlled. Dependent variables are achievement, satisfaction, motivation, amxiety, delinquency (for boys), and a number of measures of attitudes to education and vocational choice. The independent variables are measured in grade 3 and 6 respectively, the dependent variables in grade 6 and 9 respectively. The SES index can be viewed as mainly a measure of parents' education.

58

### 12 Main findings

The results show no or small effects of social differentiation on the dependent variables. A weak tendency is found for the achievement level to be influenced by the class composition. The same is the case for motivation for school work. Satisfaction with school life or delinquency rate in boys are variables which seem not to be influenced.

Background, aims and problem

The study intends to

- a) describe criminal behavior of schoolboys and the development they pass through towards law-abidingness or towards a criminal outsider group.
- b) describe their knowledge of and attitudes to crimes and sanctions.
- c) study the possibilities to predict delinquency from early information.

Scope 10

SS 1. 229. 4. 1972) OS-2 Maj 1974 G-rryck (f d SÖ 1. 229. 4. 1972)

About 500 schoolboys in Orebro. Measurements of them are available from grade 3 in 1965, to grade 9 in 1971. Information about criminal behavior is registered for about 580 boys in grade 9 in 1971. A pilot group of 520 boys was studied in

(A substudy of the Orebro project)

©-018-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

This study has been preceded by a pilot study of the population of the Orebro project - grade 6 in 1965 and grade 9 in 1968. The experiences from this study form the background of the current questionnaire. The questions given are about a number of frequently occuring types of crimes, knowledge and attitudes to actual laws and decrees. The collected information has then been integrated with information collected earlier. Data for these pupils about adjustment, behavior and performance are now available from grade 3 in 1965, grade 6 in 1968, and grade 8 in 1970 and grade 9 in 1971 and from the gymnasium school.

## 12 Main findings

60

A report on the appearence of criminality, rate of detection, police report, knowledge and attitudes to laws and decrees is available. Preliminary studies have started concerning the more longitudinal aspects.

was made within the Orebro project in :	hi ldren with different levels of peer status 1966/67. These children have since then ol and most of them the gymnasium school.

An intensive study of small groups of chi ldren with different levels of peer status was made within the Orebro project in 1966/67. These children have since then passed through the comprehensive school and most of them the gymnasium school. The purpose is now to find them and to get a picture of their development and their situation today. How do they feel about their time at school? Has peer rejection at school a serious impact on development? Does peer status in the early years at school covary with other aspects of adjustment during adolescence and the early adult years?

Investigation groups were a) 30 rejected boys and girls from the main group of the Orebro project (born 1955), b) 30 children with high peer status, and c) 30 children in the intermediate range of peer status.

11 Methods

technique.

In grade 5, 1967, interviews were made with a) the child, b) the mother, c) the father, d) the child's teachers. The teachers also made observations of each child's behavior, and the children were subjected to a medical examination. Multiple discriminant analysis has been the main statistical

In the work now being planned the main source of information will be interviews with the investigation groups. This material will be integrated with all the information from the school available from the total group investigations within the Orebro project.

# 12 Main findings

62

In the first phace of this project the background of peer status was elucidated. The results indicated that the children with low status was in a process of increasing general rejection. The home atmosphere was characterized by social passivity and isolation from the surrounding world. Also within the families the communications were deficient and conflicts usual. The parents often felt dissatisfaction with their work and with their role as parent. They seldom supported their children in peer contacts.

There are only slight differences between the groups with regard to parents' education, living conditions, work outside the home or number of divorces. The situation of the rejected children seemed to be made still worse at school by the attitudes of their teachers. The children were socially handicapped and in a vicious circle. In the next phase of the project we intend to study if and how they can break this circle.

11 Methods

The project uses data already collected by the Orebro project. Data have been collected with tests and questionnaires. Physiological data have also been collected with regard to catecholamine excretion and EEG. The research strategy is based on both a design using extreme groups, and a design using regression analysis.

# 12 Main findings

The project is still in the planning stage, and no results have yet been produced.

norm conflict, generation gap,	adjustment, symptom, adolescents
9 Background, aims and problem	

Norms can be viewed from an evaluative standpoint, but they can also be viewed as action tendencies in which case they should be closely related to the actual behavior. In an earlier investigation norms were studied for all 8 grades, and the purpose of the present investigation is to study the relationship of norm systems to other aspects of adjustment, e.g., earlier adjustment to school in grades 3 and 6. Furthermore, mechanisms behind experiences of discrepancies between presonal and parental norms (the generation gap) are to be investigated.

10 Scope

An age group of Orebro children (about 1000) followed from grade 3, who in grade 8, among other things, participated in a study concerning norms, and for girls also in studies concerning symptoms and social relations.

behavior. In an earlier investigation norms were studied for all 8 grades, and the purpose of the present investigation is to study the relationship of norm systems to other aspects of adjustment, s.g., earlier adjustment to school in grades 3 and 6. Furthermore, mechanisms behind experiences of discrepancies between presonal and parental norms (the generation gap) are to be investigated.

10 Scope

An age group of Orebro children (about 1000) followed from grade 3, who in grade 8, among other things, participated in a study concerning norms, and for girls also in studies concerning symptoms and social relations. COA

Norms are studied with a test using situations as stimuli. In ten situations of relevance to teen-agers, the subjects have expressed their evaluations and action tendencies, as well as those they believe hold for their parents and peers. Using Latent Profile Analysis, the subjects have been divided into five groups having different norm profiles. This was made for each sex separately. These groups are studied from different aspects such as earlier behavior in grades 3 and 6, symptoms in grade 8 (only for girls), and rate of delinquency in grade 9 (only for boys), etc. An extreme group with large differences between the subjects own and the parents norms are separately investigated for the purpose of finding suggestive patterns in background data.

66

### 12 Main findings

Teen-age norms are stricter than teen-age action tendencies, as measured by the used test. The overall impression is a compromise pattern with the average teen-ager trying to simultaneously take into consideration the often conflicting norm patterns of the parents and peers. Most subjects viewed the parents as norm keepers, but the peers as lenient towards the violation of norms. Conflicts with parents about norms are not felt to be important by most subjects. There appears to be no valid reason for assuming the existence of just one teen-age culture. The attitudes towards parents and peers, as well as the complete norm patterns, differed appreciably between different groups of teen-agers. Five such groups resulting from LPA showed clear differences with regard to adjustment problems in grades 3 and 6. Teen-agers with weak norms had earlier had adjustment problems, been more peer-oriented, and had less satisfactory relations to their parents. These difficulties have increased from grade 3 to grade 6. For girls, the five LPA-groups were compared with regard to frequency of symptoms in grade 8. Finally, a special investigation was performed on a group of teenagers having norms being very discrepant from the parents' norms.

A questionnaire of symptoms, divided into a number of symptom groups: asocial behavior, disturbances in social relations, psychosomatic symptoms, emotional disturbances and disturbances in self-esteem. Data were collected from psychiatric clinics and from the childrens' welfare committee and from the school registers. A sample of the girls were interviewed.

## 12 Main findings

From the many results presented on the frequency of symptoms a few may be mentioned:

1) Adult beharior is more usual in early years: 22 % have had sexual intercourse, 55 % have been drunk.

2) There are few indications of defiance against parents and other adults.

3) There is a positive correlation between symptom load and disturbed

relations to the parents.

4) An hypothesis that disturbed relations to parents may but not necessarily need lead to high symptom load could not be verified. Among girls with high symptom load, there are, however, also girls who are free from symptoms,

5) An hypothesis that asociality and anxiety are two patterns of behavior

which exclude each other could not be verified.

6) Anxious girls seem to be in a worse situation during adolescence than asocial girls.

Data from registers are being analyzed.

The purpose is to study the impact of the emotional climate in the family on norm formation, intrinsic and extrinsic adjustment, behavior, achievement and aspirations, and the educational and vocational career. In this study home factors as parents education and income must be considered. The interaction of various factors as SES, income, relations in the family, and their effects on adjustment is to be described.

10 Scope

Investigations are carried out on the main group of the Örebro project, about 1000 children born in 1955. 5014

Development, change, methodological problems

9 Background, aims and problem

Troublesome methodological problems are connected with the analysis of longitudinal data, for instance the problem of causal inferences and the drop out problem. This project aims at introducing methods and models for treating such problems, and to test these methods on various empirical problems. These include the development of the intelligence structure, sex differences in vulnerability to environmental stress, and the effects of drop out in different situations.

10 Scope

This project is a subproject within the Örebro project.

1976

A method for the analysis of covariance structures developed by Prof K G Jöreskog has been used for studying the development of the structure of intelligence. Data were taken from the Örebro projekt, and consist of test data from about 1000 school children who were tested at age 10 and retested three years later. A method for measuring "treatment effects" for non-experimental data has also been tested on the same group of children. This method is named "the prediction equation method" (PEM). An analysis of the concept of change has also been done together with an analysis of problems of causal inferences in this connection.

74

## 12 Main findings

The methodology developed by Prof Jöreskog appeared to give a clear and interpretable description of the development of the structure of intelligence. One result was that basic factors of intelligence can be described as developing independently of each other between the ages 10 and 13. The PEM methodology has been used to see whether groups of boys and girls that had been subjected to environmental stress showed any sex differences in their intellectual development. One result was that large changes in the home environment affected boys intellectual development more than girls.

## 12 Main findings

Results have now been gathered and analysed for a final report from grade 1.

Principally they touch upon:

- 1. The teachers' experiences of the experiment work.
- 2. The pupils' experiences of their schooling.
- 3. The levels of ability and knowledge of the pupils at the beginning and end of grade 1.
- 4. The teachers judgment of the behavior of deviant children in experimental classes as well as in classes for impature children.

This part of the project aims at making a broad survey of the total working situation - not only the amount of homework- of the students in the "gymnasium" schools in Stockholm. The main study was proceded by interviews with a sample of students in order to get preliminary information on how to arrange the investigation in such a way as to make the students willing to co-operate and to put their names on the questionnaires. Pre-study: An unsystematic sample of 300 students from several senior high schools in the neighborhood of Stockholm. Main study: All students in grade 2 of the 3-and 4-year lines of the senior high schools in Stockholm, 24 schools, 128 classes, 3144 pupils.

BEST COPY AVAILABLE

Pre-study autumn 1971. Interviews and questionnaires about the relevance and importance of the issues asked about, and about the possibility of persuading students to write their names.

Main study spring 1972. Data were collected in the classes by means of a non-anonymous questionnaire. Variables: school equipment, home work and study habits, types of school work, working times, absence, school democracy and attitudes to the school.

## 12 Main findings

Pre-study. The students attached importance to issues such as teachers, school buildings, syllabuses. Out-of-class activities and relationships to teachers, parents and to other students seemed to be of minor importance. Questions on social background were judged as highly irrelevant to the subject matter and to evoke a very strong resistance among the students. According to the students, it would be wise to discard such questions, otherwise the whole investigation might well be risked.

Main study. The non-responses were less than 1%. Less than 3% of the students refused to give their names. Until now, answers to questions about environment, eating and sleeping habits and working time have been analyzed. The pupils were more satisfied with the

quantity than the quality of classrooms, laboratories etc. All schools provide free lunch: 70% of the boys and 50% of the girls partook of school-lunch every day. Those who did not eat at school primarily referred to the quality of the food and the environment at the dining hall. The students calculated that their weekly working time in school was approximately 22-25 hours. Girls stated that their homework took them about 9½ hours/week, while boys estimated that their homework took 6½ hours.

The Westmanland investigation is primarily based on the so-called upper secondary school prognosis investigation (GPU). Overall problems covered include an analysis of educational and vocational routes. Specific problems include those connected with the transition via upper level of comprehensive school to upper secondary school and via upper secondary school to university and college, the socio-economic structure of school classes, the educational problems of adults and immigrants and the position of low performers. As regards the latter, particular attention is being devoted to pupils who have proceeded direct to gainful employment.

10 Scope

All pupils in the county of Westmanland belonging to grade 9 in the school year 1965/66 (c 3 700 pupils in all). For presentation of completed substudies reference is made to the bibliographic information.

	ntal requirements for the school's soal

The project studies some developmental requirements for the school's goal to create an understanding attitude towards ideological and ethical matters and to enhance the personal development in school children. This will be done through

studying what thoughts and questions concerning human life are of current interest for children at the preschool and primary school

correlating these thoughts and questions to other variables such as cognitive development and social background

obtaining information about the techers' difficulties and desirata connected with childrens' questions concerning ideological matters examining the educational difficulties that arise from childrens' questions concerning ideological matters

10 Scope

The first year was dedicated to an inventory of teachers difficulties and to planning. The second year will be dedicated to pilot studies and to developing test instruments.

9 Background, aims and problem

Child development, maturity, puberty, twins

The SLU-project is a longitudinal study of certain aspects of the physical and mental growth in twins and unrelated coevals.

The main purpose of the investigation is on the one hand to study the physical and mental growth in school children, on the other hand to study hereditary and environmental influences by means of the twin group.

10 Scope

The investigation was initiated in the spring of 1964, when most of the participating pupils were in grade 3. They were sampled from 40 different cities and consisted of 91 monozygotic twin pairs, 135 dizygotic like-sexed

Height- and weightmeasurements and a rating of the development of the secondary sexual characteristics have been carried out every half year from grade 3 to grade 9. For the boys continuing upper secondary school there are measurements for an additional year. Information on menarche has been collected for the girls. From grade 3 to grade 6 the students have completed every year atest measuring concentration, persistance and achievement. (Kup). A smaller group of pupils have completed the test in grade 7 as well.

Standardized achievement test results and the students' ratings of their own results have been collected in grade 3 for the subjects swedish and mathematics and in grade 6 for mathematics. In grade 3 and grade 6 teacher ratings were also collected for the participating students. Marks in the subjects swedish, mathematics and english are available from grade 6.

A multidimensional test measuring certain factors of importance for the development during puberty and a sociometric test has been carried out in grade 4 and 6. In grade 5 certain parts of an intelligence test (DBA) have been given to the participating students.

Certain additional socioeconomic information about the pupils are at present being collected.

88

### 12 Main findings

Height- and weightdiagrams have been constructed on the basis of the SLU-material and are presently being tryed out in the school health departments. Data processing of the physiological measurements in the SLU-project shows a secular trend, that is today's school children are on the average taller and the physical growth spurt comes earlier than before. There is also a difference of approximately 2 years between boys and girls in physical maturity. On the whole

the variation in this respect is very great and the difference amounts to approximately 7 years between the earliest maturing girl and latest maturing boy. Data processing of the Kup-test shows a continual growth of achievement for both boys and girls from grade 4 to grade 6. In grade 6 the girls have significantly better results than the boys.

Preliminary results from the students' ratings of their own achievement in connection with the standardized tests in grade 3 and 6 does not show, as was expected, a growing realism in their judgments with growing age. On the other hand the students seem to be more consistent in their judgments in grade 6 compared to grade 3.

ERIC

# 11 Methods

- 1 Systematic observations with a time-sampling method
- 2 Two parallel achievement tests
- 3 Two different knowledge tests concerning examination behavior
- 4 Pupil- and teacherquestionaires

Chi-square, t-test, two-way analysis of variance and median-test.

#### 12 Main findings

Compared with normal groups expected significant differences were obtained concerning work-distribution, communication and reporting behavior. No significant differences concerning other observed categories. Most groupwork-achievements were improved. No crucial differences concerning examination behavior. Pupils and teachers showed positive attitudes towards the groupwork-instructions.

Institute

The data come from intelligence tests and study skill tests, questionnaires about study habits, achievement motivation and social conditions and from lists of marking at the end of grade l.

The analysis has been carried out by aid of group comparisons and different kinds of correlations between all variables.

#### 12 Main findings

We have found correlations between intelligence, marks and study skills. The correlation between study skills and the pupils' marks diminishes, when by aid of partial correlation analysis, the influence of intelligence is eliminated.

Study habits and achievement motivation are correlated, intending that the pupil with strong achievement motivation really is active in connection with his studying and demonstrates what is called "good" study habits. Further are these two mentioned variables correlated with the pupils' marks. When achievement motivation is partialed out, the result is that the study habits no more have any common variance with the marks.

The group analysis gives some hints that training reading is to recommend in order to facilitate the study work and increase the achievement in school.

The aim of the project is to find ways during the introductory period when a student is just starting a particular division in the school system to:

- 1. make it easier to draw up individual programs by giving the prospective teacher the best possible information concerning both the students knowledge and abilities and their non-cognitive functions, as well as their work habits and social relations.
- 2. to involve the students in the planning of the instruction and thereby achieve increased motivation.
- 3. to inform the students about the nature of the work in the new division.

10 Scope

Experimental and control groups including 11 schools, 25 classes, 540 pupils, thoir parents, teachers and advisors, as well as school adminstrators.

	including 11 schools, 25 classes, 540 pupils, isors, as well as school adminstrators.

88

Review of the literature on the evaluation of non-cognitive functions. Procedures used with the experimental group: In grade 6 procedures drawn up by teacher groups were used, as well as teacher contacts between divisions, student advisor conferences and information to teachers, students and parents. At the beginning of grade 7, a comprehensive diagnosis of the pupils cognitive and non-cognitive functions was carried out, in order to make it easier to draw up individual student programs.

Measurements: The students' emotional and social adaptation was determined by questionnaires. Standardized tests, progress and grades are collected from grade 6 and measurements of the students' knowledge and abilities in, mainly, mathematics, English, Swedish and civics takes place in grade 7. The experience of the pupils, the advisors, and the teachers and school officials with the procedure used during the transfer stage will be evaluated. In addition, while the effects of the procedures being used with the experimental classes are being recorded, there will be a successive follow-up of the processes being used in the control classes.

#### 12 Main findings

The aim is to analyze the school situation of physically disabled pupils integrated in normal classes or in special classes for disabled pupils. The intention of the project is to describe the situation of the disabled child and how this affects the teacher and other pupils in the class. How the children's treatment situation and leisure time are influenced by the different school placings will also be studied.

10 Scope

The group to be investigated comprises 240 physically disabled pupils in the comprehensive school all over Sweden. The pupils themselves, their parents tandbars, headmasters and physiotherapiets will be interviewed.

Data for analysis and study of the problems have been collected with the following research instruments:

- 1. The pupils experience of their school situation.
- a) Pupils attitudes to school (their well-being has been investigated by questionnaries)
- b) Social status and social relations are studied by sociometric tests
- c) The pupils' self-esteem is studied by self-ratings
- d) The pupils are rated by their head teachers.
- 2. Attitudes to handicapped children from people in their environment.
- a) Pupils attitudes to different forms of handicap are studied by their reactions to descriptions of various handicaps
- b) Parents' attitudes are studied by questionnaries
- c) Teachers attitudes are also studied by wuestionnaries.

#### 12 Main findings

The data collection has to the greatest extent been concentrated in the months March-May 1972. Results from the first part of the study has been published in a comprehensive report 1973.

#### Background, aims and problem

The work was initiated by our experience with a construction of a method for primary ADL-training. We were unsatisfied with what the learning theorig gave us in the work. We needed an analyses of the goals from the standpoint of the mentally retarded.

Our aim was to reach deeper knowledge about the mentally retarded as individual and about his relation to the environement. We then analysed how a developing miljeu ought to be shaped and how we should be able to shape it for both the mentally retarded and their environment.

The following areas are treated: The development of identity of the mentally retarded, general goals, programs and methods, the environment of the mentally retarded and the mentally retarded in the organisation.

S ¢

We have worked with 100 mentally retarded intensely. They are on different levels and live and go to schools in different milieus. We have also worked with parents and personal.

The work was initiated by o	our experience with a construction of a method for

primary ADL-training. We were unsatisfied with what the learning theorig gave us in the work. We needed an analyses of the goals from the standpoint of the mentally retarded.

Our aim was to reach deeper knowledge about the mentally retarded as individual and about his relation to the environement. We then analysed how a developing miljeu ought to be shaped and how we should be able to shape it for both the mentally retarded and their environment.

The following areas are treated: The development of identity of the mentally retarded, general goals, programs and methods, the environment of the mentally retarded and the mentally retarded in the organisation.

10 Scope

We have worked with 100 mentally retarded intensely. They are on different levels and live and go to schools in different milieus. We have also worked with parents and personal.

Our goal to work for the developing environment demands understanding of their needs, interest and intentions. This means that there is a need of an understanding theory that can be a support in a process of interpretation. Therefore we have chosen a hermenuetic philosophy. Our interest of knowledge is hermeneutic and critical-emancipatory. Our choice of theory psychoanalytic theory and Piaget's kognitive theory. Our method is action research that is build in dialogue and works with a formulation of contradictions. Kriteria are a kriteria of meaning and a kriteria of emancipation. They are connected to to the interests of knowledge and to the work with theory and practice.

We have been koncentrated on different levels in the work of mental retardation: Individuals, groups and structures. We began with the individuals and formulated then general knowledges in goals and programs. We have also discussed the konsequencies of the structure of organisations.

#### 12 Main findings

We have analysed the development of identity of the mentally retarded and have seen it through a normal theory.

General goals: We have analysed what is important of different miljeus (living, schools and leisure time) and what it means for the individual and his development.

Program and method: We have discussed from the theoretical standpoint what a program is and what methods stand for.

The environment: What the environment needs for development is analysed and methods are tested.

O rganisation: Here we also have analysed the organisation and what it stand for and what is needed to get possibilities to develop.

sign language, teaching of the	deaf	
9 Background, aims and problem		,

In the teaching of the deaf there are great problems in communication in general and especially in teaching spoken language. This has lead to an increasing interest in sign language since the use of sign language might lead to easier and faster language acquisition and give more time to the acquisition of other kinds of knowledge. No serious study has previously been made of sign language so our knowledge of sign language is extremely limited. To make it possible to decide whether or not it should be introduced into the special schools for the deaf sign language must be analysed. In the last few decades the organisation of the deaf has demanded that the so called total communication method should be used in the schools for the deaf, e.g. the simultaneuos use of sign language and spoken language. Sign language must be described before it is possible to investigate if it is suitable for accompanying spoken Swedish.

10 Scope

Current status of the aforementioned analyses will be reported biannually.

The organisation of the deaf has demanded communication method should be used in the the simultaneous use of sign language language must be described before it is it is suitable for accompanying spoken
10 Scope	
Current status of the afor annually.	rementioned analyses will be reported bi-

11 Methods

The description of sign language is made according to the methods of structural linguistics where units at different levels are described. So far the minimal contrasts (such as shape of the hand, movement, and position) of the signs has been described. Such an analysis will make it possible to construct a writing system which is adapted to sign language. In the next step sign-formation (of word-formation) will be analysed and after that syntax (sentence-formation).

The nurely linguistic feasibility of the simultaneous method will be elucidated on the basis of a comparison of Swedish and sign language.

# 103

#### 12 Main findings

We would like to stress that even at an early stage it was possible to ascertain that sign language is a true language - a fact which sometimes has been questioned - and that it is a language with the same type of complicated and ingeniuos structure as other human languages.

Another result, perhaps more concrete, is that it has been possible to construct a writing system (transcription system) for sign language on the basis of the analysis of the signs. The system will mainly be used in the research project but it is also designed to be useful in the compilation of sign language dictionaries.

(For a more detailed accuont of the findings see the reports cited below.)

## 11 Mathods and findings

In this book studies are reported concerning the possibilities of predicting performance at work and adjustment to work in mentally retarded adults by psychological tests and observational methods.

After reviewing earlier efforts of this kind, the author describes the prediction variables used, viz., measurements of psychomotor, spatial-inductive and numerical abilities and also observations of behaviour in general work situations. The criterion is defined as a primarily quantitatively determined capacity to carry out approved tasks in a sheltered workshop. During the first stage of the investigations the author procured three subjective ratings of this capacity which proved to be highly reliable. Later, eight tasks were selected which provided objective measures of the criterion variable. Finally, the author developed a number of composite criterion measures which are based on the measurements and systematic observations made in connection with the eight tasks.

The predictive power of the abilities and of the behavioural observations was determined by repeated stepwise multiple-regression analyses. The results show convincingly that combinations of the above-mentioned variables can function as valid predictors, regardless of the criterion measures used - subjective ratings, objective measures of performance on individual tasks or composite measures of performance and adjustment.

It is of special interest that the author is able to demonstrate a certain dimensionality in the work performance of the mentally retarded and that he finds an apparent relationship between the nature of the tasks, as revealed by factor analyses, and their predictability. Thus, it seems to be possible to make more accurate predictions of performance on long-cycle and complex tasks, which also require the handling of tools, than of corresponding performance on short-cycle and simple tasks.

The above abstract summary is reprinted from the back cover of Rikard Palmers book: Prediction of Work Performance and Work Adjustment in Mentally Retarded Adults.

## 11 Methods and main findings

Research on two methods of teaching reading and a technique for individualized training is reported on. This research was summarized in part in two previous reports. The characteristics of the methods are described as well as qualitative and quantitative differences in the results obtained and teacher evaluations of the methods and the technique.

One method is representative of traditional ways of teaching reading, while the other, called the "psycholinguistic" method, differs in a number of important respects from traditional teaching.

Students instructed by the psycholinguistic method obtained better results, both

quantitatively and qualitatively.

The quantitative evaluation took into account how much of what was presented to them the students had mastered and the total amount they had learned. The qualitative evaluation was effected by analyzing the errors made in relation to what it means to be able to read and the effects of the two methods which can

be attributed to the different training procedures. The technique for individualization had no apparent effect, which may be explained

by the fact that there was very little such training.

x in progress

A study of the available literature was carried out when the project started. A number of questionnaires have been sent to different groups of students and teachers in order to get a basic information. Experimental studies with experimental and control groups are in progress.

#### 12 Main findings

- 1. Concerning the integration of the visually-handicapped in primary school, one of the investigations shows that the system used functions quite well with the exception of the provision of literature and information to the teachers.
- 2. The published bibliography includes 400 titles in areas relevant to the project.
- 3. The investigation of verbal descriptions of visual material in the talking books suggests that it is only worthwhile to give short, summary descriptions of the main information in illustrative material, the detailed descriptions are more or less meaningless.
- 4. Investigations of the talking book show that an increase in speech rate of up to 20% (using accelerated speech), will be tolerated by an untrained listener. In addition, the investigations of the talking book have shown that visually presented information is clearly inferior to auditory information, at least with respect to short-term-memory.
- 5. The investigations concerned with difficulties in studying show that all student groups have problems with talking books, primarily an inability to read quickly and to find one's place in the talking book.

9 Background, aims and problem

The project has two main aims: 1. In continuation of work carried out during the last few years, tests are constructed and evaluated for different levels of the Swedish school system: standardized tests for grades 6 and 8, standardized tests for grade 2 of the 'gymnasium' (students aged 13, 15, and 18 respectively), diagnostic and final tests for teacher trainees at Sweden's 15 colleges of education. All the tests are in English as a foreign language, and the results are used for grading as well as for research purposes (comparative studies etc). - 2. The second task for the project is a three-year longitudinal evaluation of the teaching of English in Sweden. The background of this latter study, which is in a planning stage, is partly the experiences made in the project over the last few years, partly the debate on language teaching, which has come to concentrate on objectives and on the question of whether the objectives set in our standard curricula are achieved.

10 Scope

The tests produced and administered by the project are taken by all Swedish students at the levels concerned, i.e. about 110 000 per age level. The

The project has two main aims: 1. In continuation of work carried out during the last few years, tests are constructed and evaluated for different levels of the Swedish school system: standardized tests for grades 6 and 8, standardized tests for grade 2 of the 'gymnasium' (students aged 13, 15, and 18 respectively), diagnostic and final tests for teacher trainees at Sweden's 15 colleges of education. All the tests are in English as a foreign language, and the results are used for grading as well as for research purposes (comparative studies etc). - 2. The second task for the project is a three-year longitudinal evaluation of the teaching of English in Sweden. The background of this latter study, which is in a planning stage, is partly the experiences made in the project over the last few years, partly the debate on language

10 Scope

The tests produced and administered by the project are taken by all Swedish students at the levels concerned, i.e. about 110 000 per age level. The longitudinal study will involve between 5 000 and 10 000 pupils.

#### 11 Methods

The new tests for the various purposes are constructed and tried out in a number of steps before they are used on a larger scale. The results of the populations or, in the case of the standardized tests, of large samples are analysed by computer to yield item analyses in order to facilitate revisions as well as results on individual pupils and groups of pupils incorder to yield norms for grading according to the 5-grade scale used in Sweden (7-24-38-24-7 %). - In the longitudinal evaluation study four groups of pupils will be used, and the groups will be followed for three years, through grades 4-6, 6-8, 8-10, 10-12, respectively. Tests will be given on four occasions; at the beginning of the study and at the end of the school year in 1975, 1976, and 1977.

# 12 Main findings

Results have been discussed in the two reports mentioned below and in a number of internal PM's at the National Board of Education. From the new study there are, as yet, no results, of course.

- 1) The passages in the curricula dealing with the teaching of English are scrutinized in detail. All passages which contain explicit goal descriptions or which could be interpreted as containing implicit goal descriptions are noted and objectives are formulated from them.
- 2) The objectives derived in this way are noted on cards and catalogued with the aid of a classification scheme constructed on the basis of a general taxonomy and some taxonomies specially designed with regard to foreign language teaching.
- 3) The generality level of the goal descriptions and the scope of the objects of behaviour in the objectives are examined.
- 4) Systematically arranged and therefore more readable presentations of the objectives defacto met with in the curricula are given. In this way it is possible to observe points, at which new objectives should perhaps be inserted, and points, at which it would seen advisable to define the objectives more clearly. In the case of the "gymnasieskola", comparisons with the objectives for the teaching of German and French are also made.

12 Main findings

The final report of the project will be published in 1974. The first phase of the project, the 1963 studies, has been reported in the works listed below.

Some results of the language investigation 1972 have been reported in papers as per below.

9 Background, aims and problem	
In order to give immigrant children to live and functi	children the same opportunities as Swedish on in the Swedish society, it is necessary models which directly lead to bilingual
mastery of immigrant chilin Swedish in order to at to develop models and met children in Swedish preto study and anlyse bilin the relationship between	roject are: the linguistic abilities and language dren first in their mother tongue and then tain a functional bilingualism, hods for the bilingual teaching of immigran and comprehensive schools, gual learning with special consideration of language 1 and 2, as well as the relation- ic development and other relevant factors.

10 Scope

Bilingual pre-school teaching for 5 to 6 years old immigrant children. Bilingual teaching of immigrant children at the lower level of comprehensive school.

At pre-school level: Setting up of bilingual teaching model and evaluation of it's outcomes through new conceived tools for the testing of concept development, language development in Swedish and Finnish, and the evaluation of concept teaching in mathematic.

At school level: Setting up of an integrated bilingual teaching model and evaluation of it's outcomes through various standardised diagnostic tests of writing and reading both in Swedish and Finnish, and the attainment in arithmetics.

# 12 Main findings

During the school year 1972-73 two teaching models based on bilingual principles and theories have been set up at pre-school level. A report summarizing the pedagogical processes has been worked up and published (see below).

-Muring the school year 1973-74 a single bilingual teaching model has been set up at pre-school level and it's outcomes has been evaluated through various testings.

A report about this activity will be published soon.

A bilingual teaching model for grade 1 of the lower level of the comprehensive school has been set up and it's outcome evaluated through various diagnostic tests of language and mathematical attainments. A report about this activity will be published later this autumn.

### 11 Methods

The research and production of study material carried out by the UMT project has been made possible through the cooperation of researchers, language experts, methodologists, writers, publishers, teachers and students. The researcher and writer group transforms the results of the basic research into general principles for the compilation and construction of study material. This material is then tried out and the measures taken to revise it are dependent on the students' achievements and the reactions of the teachers. The work of the UMT project can be divided into four main phases:

- 1. Pedagogical analysis of prerequisites: analyses of goals, students and material
- 2. Pedagogical process analysis with experiments in teaching methods
- 3. Pedagogical product analysis with various kinds of testings
- 4. Production of study material according to the results obtained from points 1-3.

12 Main findings

126

Among the results obtained can be mentioned:

- 1. The teaching system of the UMT project has proved to be superior to a number of other study materials with which it has been compared
- 2. The attitudes of both teachers and students to the study material of the UMT project are positive
- 3. The variation between classes is considerable, which indicates that variation causes other than the study material are of great significance
- 4. A very large part of language skill can be described in the following three factors: knowledge of grammar and vocabulary, intelligence and pronounciation
- 5. The students should have access to text in the introductory lessons for beginners
- 6. Grammatical surveys produce good effects
- 7. The two-language word-list is more effective than the single language one
- 8. The investigation of toleration shows that the choice of the wrong word often leads to misunderstanding, while grammatical mistakes are not so important in this respect.

Background, aims and problem

The major purpose of the IEA survey has been to study the relationship between achievement as measured by performance on international tests, measuring both cognitive and non-cognitive outcomes, and relevant input factors in the social, economic and pedagogic domain. These relationships have been studied in a series of educational systems in the hope of drawing useful generalizations. The data from Sweden makes it possible to attempt to assess the produktivity of the Swedish school system as well as a detailed study of differences and changes in achievement and attitudes throughout secondary school.

It is hoped that useful conclusions will emerge concerning the relative importance of the variables which are included in the study

and that these will assist in decision making.

Students aged 14 years (in grades 7 and 8), students in grade 9 (the last grade of the compulsory school) and students in the pre-university grade. Teachers of English, School Principals.

4 Project - and investigation leader

Data are available from a representative sample of 7 700 students and 1 300 teachers in Sweden. Data were collected in 1971.

The tests used in the study include a variety of Reading, Listening, Writing and Speaking items. Most items are of the multiple choice type, but there are tests of an open ended type also, such as dictation, as well as productive tests in Writing and Speaking.

Attitude tests, student questionnaires and teacher questionnaires were also administered.

Readability. English.	

9 Background, aims and problem

The purpose is to investigate if the Swedish instrument for measuring the degree of difficulty of school text (lix) may be applied to English text in general, as well as school texts in particular. We are also studying what types of texts the students like and dislike.

The Swedish formula has the following simple form: Sentencelength + Wordlength = Lix

Wordlength here means the percentage of words with more than 6 letters. Sentencelength is the number of words per sentence, and Lix is purely a shortening of the Swedish läsbarhetsindex.

10 Scope

100 texts were selected: 20 from children books, 30 form light fiction, 30 from factual prose and 20 from technical literature. All included about 400 words and were alike typographically. Their degree of difficulty was judged by 14 Englishmen and 14 Swedes.

ERIC

Full Text Provided by ERI

#### 11 Methods

The investigation has on the whole followed the pattern used by most researchers during the last decades. The main points are as follows: The basis for the investigation - the criterion - consists of a number of books or texts, whose degree of difficulty has, by one means or another, been estimated.

The second step is to select such linguistic elements, readability factors, which are thought to account for the text's degree of difficulty. These can be, for example, thelength of sentences or the use of abstract words. By analysing the correlations, the factors which together measure readability best are selected. The criterion is compared with every readability factor and with different combinations of them.

Finally, standards for the readability index must be set up so that they can be interpreted and understood. The final result is normally expressed by an equation - a readability formula.

#### 12 Main findings

The main results from the first part of the project is that lix functions very well on English text. Its validity - before correction for attenuation - is .92. We have earlier got coefficients of exact this magnitude by similar studies on Swedish, German and Danish language.

Also the norms for lix are the same for English as for Swedish and Danish. Texts with lix around 20 people usually judges as very easy, lix around 30 means easy, 40 medium, 50 difficult and 60 very difficult. The figures for German are throughout five units higher.

In the second part of the project we made norms for English school texts, used in Swedish schools. A great number of teachers and pupils decided the suitable grade(s) for 100 school texts. Norms are given in the report below, which also contains a list of 1 360 English books and texts with figures for lix, sentencelength and wordlength.

Background, aims and problem

It has been maintained that obligatory instruction in English ought to begin in grade one of the comprehensive school. The reasons given have been partly derived from learning theory, and partly from ideological principles: It has been thought desirable to improve the possibilities for general communication so that there will be more equality among men in various areas.

Before 1970 an average of 3.5 hours per week was spent on English from the fourth through the ninth grade, or a total of approximately 840 hours of instruction in the comprehensive school. Since 1970, these hours have been distributed over grades 3 through 9. The aim of the project is to investigate the effect of distributing

these 840 hours over grades 4-9, 3-9 and 1-9.

The effect will be measured in terms of cognitive, psychomotor and affective functions, both in English and in other subjects, especially Swedish and mathematics, but also French and German. The subject of Swedish is of particular interest, since changes in the timetable for English result in changes in the timetable for Swedish.

The investigation includes a sample of 2, 000 students. These children will be followed for nine years. Critical measurements will be made after 3, 6 and 9 years of instruction, respectively. The immigrant children in the group will be the obEnglish in the Primary School. (Project EPAL)

Completed

The groups under study are divided into four treatment groups. One group begins English according to the study plans for grade 4, two groups according to the plan for grade 3, and one group begins English at the second semester in grade 1. The last-mentioned group and one of the groups which in grad 3 are using the same material and are being treated alike in every other way, except for the distribution of instruction hours in English. The other groups are using somewhat different material, but are otherwise being taught in approximately the same way. Each group contains appr. 10% immigrant children.

At the end of each school year attitude measurements are made, as well as measurements of ability in Swedish and mathematics. The aim is to see what between-group differences there are which appear to be the result of the experimental treatment. Proficiency in English is tested after a certain number of instruction hours, the same for all groups. In addition, classroom observation are made in order to study

teacher-pupil interaction during the English lessons.

One subgroup of the project-team is constructing teaching materials for the first three grades. The working principles used in the preparation of these materials have been arrived at by a thorough analysis of both Swedish instruction material in English as well as similar material produced abroad for English and other foreign languages. Oral communication skills are specially studied.

## 12 Main findings

Since three of the groups do not begin English until the autumn term of 1972, no comparisons have yet been made. The methods and materials used in the other group have been evaluated by a battery of diagnostic tests administered on three different occasions. Special effort has been focused on the development and testing of methods for measuring pronounciation, intonation and proficiency in speaking. Measurements of Swedish and mathematics, as well as attitude, have also been made, and data analysis is in progress. Special attention is given to the achievement of the immigrant children.

Ongoing studies include methods of measuring pronounciation among nonliterate (in cooperation with the Department of Speech Transmission at the Roval Institute of Technology, Stockholm) observational studies in the classroom (interaction and efficiency studies) as well as evaluation of the methods and materials system being developed for the project.

9 Background, aims and problem	

When discussing reading in the mother tongue a lot of investigations put forward evidence supporting different hypotheses as regards what components might be of importance when it comes to learning to read. However, there are apparently no such investigations as regards learning to read a foreign language in the primary school. There seem to be reasons to suppose that especially low ability pupils need a rigidly structured reactivation of the language material they are to see in print and read, and that the absence of a reactivation of this kind might seriously obstruct the learning process. The purpose of this investigation is to determine whether this is the case and also to try to shed light on factors of importance to reading ability in a foreign language.

10 Scope  The investigation comprises 360 pupils in the town of Västerås. The pupils us	divided into 16 teaching units in Grade 4 e the teaching material produced within the
EPAL project.	- 176 A

During the experiment in the autumn term of 1973 the 16 teaching units were divided into two groups, one experimental group and one control group. During half the period of the introduction of reading, i.e. for about 6 weeks, the experimental group did not receive the rigidly structured oral drill which introduces every lesson with the introduction of a new phoneme.

At the first point of comparison (i.e. when the experimental group takes up the oral drill earlier left out) and at the second point of comparison (i.e. when the introduction of reading can be regarded as completed), reading comprehension tests, oral reading tests (with sample of pupils), and attitude tests were carried out. The 17 diagnostic reading comprehension tests belonging to the teaching material are also used in the statistical process. Pupils with reading difficulties in Swedish form special group when analyses are made.

## 12 Main findings

Since the data so far computorised - background variables and results from the points of comparison (except the oral reading tests) - have not yet been analysed, no reliable results are at this date available.

8 Keywords	
English. Second language teach Applied linguistics. Experiment	ing. Computational text analysis. Data processing.

9 Background, aims and problem

Research in language teaching has always faced a dilemma: if the language behavior under study has been sufficiently complex to approximate real language behavior, it has been humanly impossible, within such complexity, to: 1) provide a rigorous description of every language feature included, 2) state exactly how knowledge of each such feature has been defined, i.e. what use of each feature every teaching procedure associated with it is designed to elicit, and 3) establish that proficiency in each feature, as so defined, has been adequately tested. Yet these criteria must be met if experiments are to be repeatable and the results unambiguous. The purpose of the proposed research would be to try to develop and demonstrate a system for meeting the above criteria by using techniques for non-numeric data analysis now made practicable by computers, which can perform the otherwise overwhelming processing of language data.

10 Scope

-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

ar a comprex ranguage teaching experiment

-01-018-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

MA

During the development phase of the research, three analyses would be prepared:
1) a linguistic analysis of the EPAL textbooks, which would provide a complete description of the EPAL subset, 2) an analysis of EPAL procedures which would make explicit how proficiency had been defined in the classroom, and 3) an analysis of EPAL tests which would make explicit how proficiency had been defined in the tests.

The plan would be to express the results of the analyses as continuously updated lists of code-named classes with cross-references, so that a computer could be used to sort through them and print out new ones for specific kinds of comparisons.

A The EPAL project (engelska på lågstadiet) is described elsewhere in this catalog.

Translation of children's books; Children's books; Literary instruction; International understanding, promoting of.

Background, aims and problem

There are few scientific studies in order to supply basic data when public measures to forward the translation of children's books are considered. This means, for example, that the methodology of such studies has been treated to a very small extent.

The main problems to deal with are: 1) How children's books to be translated are selected, 2) How the books are in fact translated, 3) Attitudes to the quality of translations.

The ultimate aim of drawing attention to these problems is to give young people better access to literature of top quality and to give them an international outlook. The implementation of these objectives is the task of kindergartens as well as of schools. The three main problems mentioned are, therefore, of consequence for the daily work of teachers and pupils as well as for the work outside school to stimulate and help young people in their reading.

100A

Systematic presentation of problems and testing of different methods for studies of

- 1) the relative importance of different languages (the production of translated literature in general, top quality literature, books with certain content or readability, the reasons why books in certain languages are translated more often than books from other languages)
- 2) the qualitative selection of books translated or in stock (the methodological problem how to construct lists of books that "ought to" be translated, the reasons why the qualitative choice is made as it is)
- 3) how children's books are in fact translated (coding scheme, forms to be filled in, exemplification of some categories of change by way of a detailed survey of five books translated into Swedish)
- 4) the treatment of translations of children's books in reviews (systematic examination of reviews in the daily press as well as in journals entirely devoted to review, classification of different content of criticism of translation work)

## 12 Main findings

A systematic presentation of the problems. Suitable methods for investigations on a larger scale.

#### 11 Methods

The main study has so far comprised:

- 1) Testing of the selected samples on two occasions with an interval of one year. The study is thus mainly cross-sectional but to some extent longitudinal. The development of the abilities involved is described of the basis of test data. Further information on tests etc. are given in School Research Newsletter 1973:2 (see below).
- 2) A questionnaire sent to some 950 teachers of Swedish language concerning what are satisfactory ability levels in students leaving different school forms. The questions were based on the tests used in the study. The opinions of the teachers can therefore be directly compared with the observed ability levels.

# 12 Main findings

- 149
- 1) A preliminary analysis of test data shows, among other things: In nearly all the investigated abilities there is a continuous growth from grade 1 to grade 11 and apparent stagnation in grade 12. From grade 5 to grade 11 the growth curve is in most cases almost linear, i.e. the increase in ability is constant from grade to grade. The overlap between grades is considerable. The weakest students in grades 11 and 12 are often below the grade 6 average, whereas the best in grade 6 reach the average of the upper secondary school.
- 2) The teacher questionnaire shows that many teachers find it difficult to judge what ability level an average student should reach in, say, reading comprehension. Among those teachers who did try and make such judgments the variability in opinion is great. Some teachers demand, for instance, more from grade 9 students than others do from grade 12 students. The results indicate that it will be very difficult to reach general agreement as to the 'behavioural objectives' of instruction in this area.

(rroject ricia)

The project is a follow-up study of about 200 pupils from different districts in Malmö during a three-year period. The problems stated above are studied in eight data collections.

11 Methods

BEST COPY AVAILABLE

The studies of language quality and development involve investigations of what objective standards may be found in written language and validation of these standards. The criteria for the validation have mainly been marks in composition writing and verbal tests.

The investigation of measures to stimulate students for the compositions are carried out through questionnaires and experimental studies in the school situation. The three experiments have aimed at various degrees of guidance by stimuli and concentration on factual or emotional treatment, subjects chosen from popular children's books and concentration on creative or formal instruction and various degrees of reality. The studies of social variation in language ability have been made possible by choosing students from three different school districts in Malmö, representing high, medium and low groups respectively in a social index.

## 12 Main findings

The investigation of validity has given some preliminary results. About 400 linguistic measures have been validated. Among these with the highest correlation with students' marks in composition-writing may be mentioned number of different words in the essay, number of words, number of punctuation marks and number of sentences, i e various measures of productivity.

A factor analysis was carried out on 87 of the 400 linguistic measures giving the following factors: productivity, length of words, syntactic length of sentences, adverbials, subordinate clauses, graphic length of sentences, attributes, coordination, verbs and adjectives.

The completed projects Skrivsyn (Swedish measurements) have maked language of upper secondary school and between the groups of student present project is to produce cobasis of the gauges of quality ob	ntax (Syntax in written language) and Svenska Mått nade detailed comparisons both between the written nool students and professional non-fictional prose nts with different grades. The purpose of the increte material for the training of writing on the stained and to test empirically the effect of the e traditional type of writing training.

10 Scope

7 teachers, each with one experimental and one control class in the first year of the three-year upper secondary school (grade 10)

11 Methods

A research program, directed at general skill in writing and a control program, directed at specific skills in writing, will be followed, each covering 20 lessons. Both are preceded by an objective pre-test and a pre-essay and followed by a post-essay. The pre-essays and post-essays are compared linguistically, both objectively and also subjectively, by means of teacher assessments.

# 12 Main findings

Firmly based answers can be expected to the following questions:

1. Which model for the training of writing is best, the one that deals with particular types of production or the one that emphasizes general writing skill?

2. Which of the programs most influences the language of the students in the direction of the style found in informative non-fictional prose?

3. Which types of students gain most from the different programs for training writing?

4. Is the study of grammar of any use in the training of writing?

The meaning	present 140 000 0

At the introductory stage there was an analysis of the purpose of the project and of the research work. And there was a questionnaire for teachers in order to mar out habits and needs. Tests were made to make it possible to decide the different levels.

Authors of children's books have written the original texts, wich also have been examined by the project expert team. The research centre has produced the training and guidance material. The expert team included 12 persons (school inspectors, school librarians, consultants and teachers).

The material for grade 4 was tried out in about 60 classes in the schools of Stockholm. The evaluation had tree moments:

- 1) Asking for experiences and attitudes of the teachers and the pupils after each lesson.
- 2) Tests of reading ability before and after the whole program.
- 3) A questionnaire on the material as a whole at the end of the year.

## 12 Main findings

157

The main results of the try-out in grade 4 are:

1. The reaction on the leading principles - textversions on different degrees of difficulty, free choice of the pupils, exercises of scrambletype based on goalanalysis, a booklet-system and a special parcel for each lesson - was very positive.

2. The pupils tended to choose the difficult version in an unexpected proportion.

- 3. The readers of different ability found their versions choosen to be of appropriate level of difficulty.
- 4. The pupils ability to read, as measured by the reading test "Dödsuret", made great progress during the year. The poor readers had gained as much as medium and good readers.
- 5. The teachers critic was on the wole positive. They whised to continue with te material in grade four if it were available.

The latter referinguistic composition of text. Both books have been investigated.

measurement of legibility and readability in textbooks.

## 11 Methods

In the legibility testings preference measurements have mainly been used (eg Thurstone's paired comparisons). Readability has been measured by different types and comprehension tests. The methods can be characterized mainly as experimental. Specially constructed text materials have been used. Analysis of variance and multiple regression analysis have been used at the data processings.

## 12 Main findings

The legibility studies have hitherto shown that the subjects have very clear and consistent preferences of different types of typographic manipulations (eg line lenght, line size, type size, text area, format etc). The results further indicate that the role of pictures in text seems to be somewhat overestimated. The readability studies show that the measurements have to be based on a combination of syntactic and semantic variables.

## 9 Background, aims and problem

The purpose of the project is to map the extent and meaning of reading proficiency and popular education in Western Norrland, 1750-1860, according to the church examination records and parallel sources, in the perspective of relevant demographical and social information available in these and associated sources.

-2 Maj 1974 G-tryck (fd SÖ L 223,4, 1972)

2. Indept studies with computer in a sample of parishes during different periods.

examination registers of the church and parallel sources.

<sup>©</sup>;-018-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

#### 11 Methods

According to summaries of the source material and its contents four timeperiods are delimited, namely 1750-60, 1780-90, 1810-20 and 1840-60, Within each of these periods 8-10 intensive studies are done. These intensive studies are made as much as possible representative for different populations, geographical areas etc. Each study includes 800-1200 individuals. Data for each individual is gathered from the examination records and parallel sources e.g. tax lists, migration records and for the last timeperiod also school records of different kinds. The routines of data collection and data processing are worked out in the department of Education at the university of Umeå.

## 12 Main findings

- 161
- 1. In the first place it is evident that the church examination records lend themselves very well to treatment within the extablished framework of educational measurement. This kind of material is only found in Sweden and Finland. (In other countries in the West investigations of literacy is based on whether wills, testimony etc. are signed or not.)
- 2. The survey calculations of reading grades imply a very early spread of reading ability in Sweden (the initial surge took place between 1680 to 1740).
- 3. In the intensive studies, e.g. from the time of the start of compulsory school in the mid 1800s, there are many possibilities to put the reading proficiency and the traditional home education into a massive historical context. In this kind of studies the social environment, migration and other demographical variables are formed around the actual popular education. Such variables as e.g. profession relate to school attendance. All children, even those not attending school, get reading grades in the examination records.
- 4. In an international perspective the Swedish and Finnish examination records might be of great importance both for educational studies and those demographic studies which they offer with date processing at individual level.

9 Background, aims and problem		measurement.

Several earlier studies concerning physical education at lower and higher secondary levels have been conducted in Sweden by, among others, Engstrom (1972) and Hedberg (1972). Against this background it was judged as desirable that similar studies were made at the lower and middle levels of comprehensive school as well. The main purpose of the project is to investigate, at lower and middle levels, the objectives and methods of physical education in relation to the pupils physical development and their interest and knowledge in physical exercise at different ages. Certain factors in their immediate environment, which can be presumed to influence the pupils' interest in physical activities, will also be studied.

10 Scope

> 10 classes from each grade 1 - 6, that is 60 classes, which totally include approximately 1400 pupils.

9 Background, aims and problem

The upper secondary school curricum (1970) sanctions the evaluation of teaching results in physical education by means of physiological tests, tests of skill and pupil questionnaires. Investigations concerning evaluation and merits in physical education show that most teachers employ some form of achievement test. But the main curricular items covered by these tests vary from one teacher to another, as do the number of tests and the appearance and quality. A set of well tried instruments is therefore needed for use in this subject. The aim of the project is to inventory, develop, test and normalize a battery of measuring instruments for evaluation purposes in the teaching of physical education in upper secondary school. The battery will be composed of a test of endurance, six tests of strength and a test of attitude to physical education. whese tests shall serve as an aid to student analysis at the commencement of grade 1 of upper secondary school. The battery will also include a test which the teacher can use when he will evaluate his own teach ing and a test of interests to be used before the optional part of physical education in the last grade in upper secondary school. 10 Scope

A battery composed of a test of endurance, six tests of strength and a ERICtest of attitude will be normalized on a random sample of 220 boys and 205 girls in grade 1 in upper accondary school.

307 A

#### 11 Methods

An inventory of instruments for measurement of physical status has been carried out.

A random sample of teachers of physical education in upper secondary school was given a questionnaire, which aim was to arrive at an appreciation of the need of these teachers for different measuring instruments, their view on the use of measuring instrument etc.

on the use of measuring instrument etc. A conference concerning the need of measuring instruments for evaluation purposes in the teaching of physical education in upper secondary school has been carried out with experts within the subjects physicalogi, psychology, education and physical education.

Twelve different tests of static and dynamic strength have been developed and proved on 161 pupils. The six best of these tests have been chosen for the definitive battery.

Three different tests of endurance have been proved on 52 pupils. The best of these tests will be chosen for the definitive battery.

A test of attitude, a test of interests and a test which the teacher can use when he will evaluate his own teaching has been developed, proved and revised several times.

220 boys and 205 girls in grade 1 in upper secondary school will be tested with the definitive battery in September 1974. After that the test will be normalized and manuals for the tests will be worked out.

12 Main findings

Most of the teachers has great need of instruments for measuring the endurance of the pupils. More male than female teachers has great need of instruments for measuring strength while the opposite condition is present for motoric functions. More than the half of the teachers has great need of instruments for measuring skills of the pupils in certain activities, their attitudes to and interest in physical education. The teachers will use the instruments which measure physical status of the pupils as a motivating factor for the pupils.

The six tests of strength and the test of endurance which have been chosen for the definitive battery have all high reliability (, 72 - .96). An evaluation among the pupils which have participated in the examination showed that most of the pupils liked these tests.

Methods used have been research on literature, interviews and surveys completed with different kinds of diaries and direct observation.

## 12 Main findings

The purpose of the above mentioned studies were also to give information and knowledge about the "Sport for All" habits and effects for different groups of persons. This knowledge has since formed a basis for some experimental research during 1973/74. The so far acquired knowledge has been used for the guidance of forming "Sport for All" activities and has also been giving information about the content and extensiveness of the activity in different groups of human beings.

#### 11 Methods

Two groups of pupils, socially and intellectually comparable, have been trained in Mathematics, one group with the 1962 curriculum, the other with the 1969 curriculum. Changes in: BEST COPY AVAILABLE

1. conception of number

2. knowledge of Mathematics

3. attitudes toward Mathematics

as a function of the curriculum, have been investigated.

## Main findings

- 1 When analysing pupils' conception of number we found that children in grade 6 (12 years old) were significantly superior when trained with the new curriculum than when trained with the old one. In grade 3 (9 years old) and grade 9 (15 years old) we found no significant differences due to curriculum.
- 2. Analysis of achievement in mathematics revealed that in grade 3 pupils trained with the new curriculum had better results than pupils trained with the old one. In grade 6, on the contrary, children with the old curriculum obtained highest scores. For pupils in grade nine we had two programs, one shorter (9 A) and one more extensive (9 S). Pupils with program 9 A achieved the best results when trained with the old curriculum. For pupils with program 9 S both curriculums yielded similar result.
- 3.We found no differences in the attitudes toward mathematics related to the curriculums in any grade. The most gifted pupils had a more favourable attitude toward mathematics when trained with the new curriculum, whereas the old curriculum produced a more favourable attitude in the less gifted pupils.

1973/74 " " " " " " " " " " " " " " " " " " "	grade 7 + 8 parents grade 7 - 9 grade 7 - 9

The research is carried out in five schools. For the moment comparisons are made with "conventional" class teaching. From autumn -74 some other comparison-schools will be incorporated from communities, where other actions have been taken, that is centralization with very long periods of daily travel or lodging.

Questionnaires, interviews and continuous registration of the teaching process with information from the teachers as well as the pupils. Parents have been interviewed. The plans are to have observers in the classroom later on.

The comparison schools have been chosen to equal the descriptions made of the school communities of the research-schools (in cooperation with the Geographical institute in Umeå).

## 12 Main findings

187

Results from pilot-studies and the research program are presented in Reports 1 - 5 from the Institute of Education, University of Göteborg.

The cooperation with Umeå is reported in Reports from the Institute of Geography, University of Umeå (in progress).

The design is built up as repeated testing.

# 12 Main findings

191

One of the more important results of the analyses is that they have shown what big differences there are between the open-plan schools in the lay-out of the buildings, in pedagogic activity, and in the attitudes of teachers and pupils. The attitudes have mainly been positive, and negative points of view have largely concerned specific aspects.

The study of the effects on the pupils from the two organizational structures is not yet ready.

This research and development project is being conducted in cooperation with the Malmö Region Educational Development Activities (MED). Its general purpose is to evaluate experiments with flexible grouping and team teaching, which were started in Malmo at the beginning of the 1960's. The research project has concentrated on grades 7-9 in the comprehensive school, but some studies have also been carried out in two secondary schools.

During the school year 1973/74 the activities of the project have been coordinated with the start of a new project in grades 4-6, called Systems analysis of local school environments, including open plan schools (Project SLS). (See special

description of this project.)

10 Scope

Eight comprehensive schools are studied with regard to "stability" or flexibility" in organization and layout. Two classes in the upper level (grade 7-9) of each school have been selected and have been followed for three years.

8-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

11 Methods

Interviews, questionnaires and observation have been used to determine the degree of organizational stability or flexibility in the structure of the eight comprehensive schools. Schools built in a traditional way are compared with two open-plan schools. The development of the pupils in randomly selected classes is followed during a period of three years with regard to changes in aptitude, attitude and personality. The methods used here include intelligence tests, questionnaires and standardized tests, interest inventories and personality tests.

In the two secondary schools, only teacher and pupil questionnaires have been used.

12 Main findings

193

Up to now, the project has been at an exploratory stage, in which teacher and pupil questionnaries and interviews have illustrated a wide variety of the problems that arise when certain rigid organizational patterns are broken up. One of the two secondary schools has reported mainly positive experiences from en experimental relaxation of the attendance rule. In the other school, the results of the VGT experiments have revealed organizational difficulties and feelings of insufficient contact between teachers and pupils. The collection of data for the main piece of research, which is a longitudinal investigation of the development of the pupils in comprehensive schools with different types of organization, will not be finished until the end of the school year 1973/74. For this reason no data have yet been presented. In developing methods for these studies, there has been collaboration with another project - "Development of curricula for 'Samskap schools' ". Certain preliminary data concerning two open plan schools for grades 7-9 have been published. However, these data are so inconclusive that they are only suitable for use in formulating hypotheses for further investigations. The investigations carried out so far have formed the basis for the publications listed below.

10 Scope

Project title

(Project SLS)

Two schools in Malmö with middle level (classes 4-6), one open plan and one ERIC traditionally built school have been chosen as experiment schools. Two other schools are used as reference schools. Experiments are to be conducted during the school

the schools and research workers following what is called a problem-solving model.

1 14/()			

11 Methods

A rather large project group, representing different categories in the schools, does the general planning. Smaller groups for analyses prepare the different experimental periods. The researchers take part in the work of the different planning groups. They also, in different ways, follow the experimentation work through participating observation, systematic observation, interviews and questionnaires. They make models for evaluation instruments, which can be used by the staff. Evaluation instruments from the earlier mentioned Samskap and VGT projects will also be used in the SLS project. As the project is still at a planning stage the methods can not be specified in more detail.

## 12 Main findings

Results to report do not yet exist, as the whole school year 1973/74 has been used for the choice of schools, discussions with these and general planning in the project group.

9 Background, aims and problem

Methods of controlling productivity for use in school and educational administration are being developed and tested. The primary aim is to achieve more individualized curricula and, from the point of view of business economics, to achieve a more adequate use of available resources. This includes trying to find out how appropriate and necessary it is to divide upper secondary students into groups with pre-set curricula, and then into classes, which move in parallell and step-by-step through semester and yearly courses, during which time the students study 10 to 12 subjects at the same time. A reason for the present system may be that, up to now, the available means for the management of the school and the direction of instruction have made any other approaches practically impossible, even if they were desirable. The aim of the project is therefore to develop and test a support system and methods for the administration of instruction, which can give the students greater freedom to chose what they will study, as well as giving the teachers and school authorities a way to use available resources more profitably and deadapt them to the needs of the students.

Information system. Educational administration. Resource allocation. Educational planning. Individualized teaching. Non-graded school, Mastery learning. Data base.

Scope

Administrative routines within a large secondary school, as well as curriculum, primarily subjects included in the science block.

9 Background, aims and problem	
The main objective of the research is tinvestigations, to a better knowledge of adults. For this purpose a series of conducted, mainly with adult students a objectives of the research are to devel materials and tests, and to investigate of various teaching techniques and teach education.  The research program should be vie	mparative method studies have been s experimental subjects. Secondary op and evaluate instructional the effectiveness and attractiveness hing aids in the fields of adult wed against the methodological
dewates of the past decade or so result language and language acquisition, and adult education in recent years.	ing from conflicting theories of

Scope. The main experiment, carried out in 1970 with subjects from a municipal school for adults, was followed by two replications, one in 1971 with folk high school students and one in 1972 with adolescents from the compulsory school. The number of subjects participating in these experiments amounted to 300. A large-scale follow-up study was undertaken in 1973-74 with more than 600 subjects from the types of schools mentioned above. In addition to these studies two experiments were conducted in 1972 and 1973, one dealing with vocabulary learning and one with individualized instruction. The number of subjects, all of them adult students, was roughly 100 in the former and 50 in the latter experiment.

Methods. Treatment effects were measured by means of gain scores from pre-test to post-test. Students' attitudes toward treatments as well as interactions between treatment and some background variables were investigated.

# 12 Main findings

204

The experimental methods compared in the first three experiments were based on an audiolingual and a cognitive theory and were called implicit (IM) and explicit (EX) respectively. In the follow-up study of 1973-74 two new experimental methods, called IMEX and EXIM, were added to the original ones. These reflected less extreme views of language learning and were more eclectic in terms of teaching strategies than IM and EX.

At the adult level the EX method yielded significantly better learning effect and more positive attitudes than the IM method. No interaction effects between treatment on the one hand and age, proficiency, and aptitude on the other were observed; the EX method proved superior at all levels. The new methods did not surpass EX in any respect.

The experiments with compulsory school students yielded similar results but the pattern was not as clear-cut as with adult students. Certain tendencies toward aptitude-treatment interaction effects were observed.

The experiment in vocabulary learning by monolingual and bilingual word-lists resulted in a significant difference in favour of the latter. The experiment in individualized grammar teaching showed that the subjects had very favorable attitudes toward the model for self-instructional grammar courses that was tried out with cassette recorders.

8 Keywords

Adult education, diagnostic test, school anxiety, educational guidance

9 Background, aims and problem

The long-term aims of the project are to give increased possibilities for educational guides and individual pupils to find an adequate starting level and to try to reduce study and test anxiety of adult students.

Subsidiary aims are:

- 1. Construct and try out diagnostic tests for elementary levels of adult education (english, mathematics, swedish).
- 2. Try out alternative models for diagnosis and educational guidance.
- 3. Survey the study situation of adult students with focus on anxiety developing factors.
- 4. Investigate the effect of relaxation training concerning anxiety in the whole study situation and in the test situation.

10 Scope

The investigation includes adult students on elementary school level and educational guides.

-2 Maj 1974 G-tryck (f d SÖ L 229, 4, 1972)

ERĬC

earcation...

(The STUVA Project)

- elementary school level

Relevant data will be obtained by means of:

- a) Document analyses
- b) Individual tests in english, mathematics and swedish (see aim one)
- c) Questionnaires and interviews (aims three and four)
- d) Jacobson's Progressive Relaxation Method (aim four)

# 12 Main findings

The results so far show that the diagnostic tests in english, mathematics and swedish are functioning well. The tests can be used either so that the person do the test at home or in a group supervised by a test leader. No direct difference in result can be noticed by using the tests in one way or another.

#### 12 Main findings

The pilot study showed that there is not enough empirical support for former reasoning in the project. Earlier the following hypotheses had been formulated:

1. Considering the aims of the project the organizational classificationinto adult education is not appropriate. Adult education should rather be classified according to the external extent of objective setting— i.e. to what extent the activity is steered by objectives fixed in advance.

2. The working methods in the first place used in the teaching situation are due to the external extent of objective setting(discussions are more frequent at little extent of objective setting).

3. When there is a great external extent of objective setting the short-range results at individual level first of all are cognitive and definitely related to objectives. Concerning education with little external extent of objective setting the results are partly cognitive but also to a greater extent socioemotional and intrisical. The study showed that the students apprehend the external extent of objective setting as well as working methods from their own conception of things i.e. individuals in the same "actual" situation still were of different opinions. Nor was the third hypothesis confirmed i.e., there was no difference between the students opinions about the importance of differentkinds of results depending on how they apprehended the external extent of objective setting. The study also revealed difficulties in measuring individual contributions concerningtime and money as well as translating these into a common quantity. These difficulties depend on too little knowledge about both the study— and

9 Background, aims and problem

Discussing educational problems and educational planning, one vital question is how the communication of information from sender to receiver, from teacher to pupil best can be arranged for maximizing the satisfaction of goals, One important part of that problem is the selection of media for different aspects of communication within the education. However, in an other frame of reference or with a broader perspective on educational situations the communication processes within education is just one of several problems of the more overwhelming problem to arrange sufficient teaching/learning situations for the receiver/pupil. How thoroughly you ever prepare for a good information process that is not a sufficient condition for lasting learning. On the contrary, an arrangement of the total teaching/learning situation has to be the most fundamental factor to reach the desired effects. The media selection cannot - which very often is shown in the literature - be looked upon as an isolated part in relation to other educational planning activities. Judgements on how the total teaching/learning situation shall be arranged has to be a forecoming planning activity and added to that a determinant for the selection of media. This project is aiming to develop and evaluate a model for arranging teaching/learning situations focusing adult education.

10 Scope

Mainly non-empirical work. Some collection of data from former research and from ERICother projects at the institute.

9 Background, aims and problem

Discussing educational problems and educational planning, one vital question : he communication of information from sender to receiver, from teacher to pupil beat can be arranged for maximizing the satisfaction of goals, One important part of that problem is the selection of media for different aspects of communication within the education. However, in an other frame of reference or with a broader perspective on educational situations the communication processes within education is just one of several problems of the more overwhelming problem to arrange sufficient teaching/learning situations for the receiver/pupil. How thoroughly you ever prepare for a good information process that is not a sufficient condition for lasting learning. On the contrary, an arrangement of the total teaching/learning situation has to be the most fundamental factor to reach the desired effects. The media selection cannot - which very often is shown in the literature - be looked upon as an isolated part in relation to other educational planning activities. Judgements on how the total teaching/learning situation shall be arranged has to be a forecoming planning activity and added to that a determinant for the selection of media. This project is aiming to develop and evaluate a model for arranging teaching/learning situations focusing adult education.

10 Scope

Mainly non-empirical work. Some collection of data from former research and from other projects at the institute.

Mainly literary research. Seminars and conferences for discussions around the problem with fellow-researchers and practicians. Field studies for validation of suggested models.

12 Main findings

216

Up till now we have formed an overview-model for the selection of methods and media. In that model we present partly new guidelines for the work within this field of educational planning. We have also stated definitions for the key-concepts, method and medium - something which is lacking in the main part of earlier research.

Background, aims and problem

Adult education will probably be one of the main issues of educational discussion during the next few decades. The demands are enormous, but resources appear to be markedly limited. Therefore distance education would seem to be an appropriate solution of this problem. One of the essential requirements for distance education will be correspondence education.

Correspondence education, distance education, adult education

However, there is still a considerable lack of scientifically validated knowledge about the methodology of correspondence education. Therefore, in this project there are carried out (a) three experimental studies on two-way communication in correspondence education, concerning the importance of (1) postal two-way communication, (2) telephone instruction as a supplement to postal distance instruction, (3) group meetings as a supplement to postal distance instruction; and (b) a systematic analytical study, in order to give correspondence education a stable theore-tical basis from which hypotheses can be established for additional empirical research.

10 Scope

The experiments will be carried out in Sweden and other European countries.

8 Keywords	
Adult education, study needs, stu	dy obstacles
9 Background, aims and problem	

The purpose of this investigation is by using the individual's total life-situation and previous experience as a base to study the less well educated indivdual's:

need of adult education

awareness of adult education

motives to participate in adult education

experienced obstacles preventing participation in adult education

plans to participate in adult education

previous experience of adult education

In connection with this it is important to take into consideration the individual's position in the life-cycle.

Besides the main study a longitudinal study concerning interest and participation in adult education among young men with short compulsury education is undertaken.

## 10 Scope

The sample in the main study consists of 1 100 persons and in the longitudinal of 2 000 persons.

A

#### 11 Methods

The data in the main study was collected through interviews. See report 17 for description of the background and design of the project.

### 12 Main findings

A preliminary study was done autumn -72 where data was collected through personal interviews. Further, a trial was made with a combination of mailed questionnaire and personal interviews, Those who did not answer the questionnaire were contacted by an interviewer. The results showed that the aims of the project could not be reached by this combination. The answers on the questionnaire were too incomplete, especially on the open questions, Because of this it was decided to use personal interviews in the main study.

What training/informatio	of pedagogics for study circles ?  le differ from other forms of group study ?  the work of study circles ?  in study circles ?  on does : sircle leader require ?

The project will take the form of a subsidiary project within the areas enumerated above.

- A. Review of literature on the subject, questionnaires/interviews including experienced circle leaders.
- B. Questionnaires/interviews, participating observation.
- C. Evaluation and analysis of studies in progress.
- D. Follow-up of causes of discontinuations of study in a random sample of circles.
- E. Analysis of existing material of various kinds, experiments with different types of design.
- F. Questionnaire/interview involving new circle leaders, experiments with different forms of guidance.
- G. Summary of experience gained.

#### 12 Main findings

The project has a clearly practical emphasis and it is hoped that work will result in knowledge that can

- be used in the training/guidance of circle leaders
- be used in the production of material for courses
- be used if study circle methodology has to be transferred/adapted to other study situations (other forms of study)
- be used for the evaluation of the activities of a circle.

It is also intended to formulate problems and points of discussion that can be made a subject of future research.

Data on social background, mental ability and school results were originally gathered for all the 1,544 third-graders in the schools of the city of Malmö in 1938.

Data on mental ability at maturity were gathered for the male part of the population in 1948.

In the 1960's and 70's an extensive follow-up effort was conducted to gather educational and life career data.

12 Main findings

230

As an example of results from the Malmö study some findings from the Bulcock, Fägerlind and Emanuelsson study (1974) are given: "This study constitutes a cross-cultural replication of the Duncan model of ability, education, and achievement as modified by Jencks. The 1938 Malmö data set was used to test eleven hypotheses related to the socioeconomic career achievement process. Though the findings are supportative of main theory formulations, there are notable cross-cultural differences in the effect parameters of several specified relationships. It was shown that in Sweden father's occupation was not merely a proxy for family income in accounting for sons! educational attainments. Background effects in Sweden were more likely than in the U.S. to be mediated by the mechanisms of schooling and ability especially in terms of impact on occupational status. Background effects were also more powerful than in the U.S. as determinants of education; and educational effects more powerful determinants of ability at maturity. In the final reduced form of the Malmö model of ability and achievement it was shown. that the effects of system relationships accounting for income were almost identical to those found by Jencks in his analysis of U.S. data. Scepticist was expressed as to the capability of the functional form of the additive linear model to capture income variation."

ACHOOL BLUGIES TOL SOUTE

ESS 1974 G-tryck (f d SÖ L 229, 4, 1972)

A number of instructional groups will be followed during the period of time normally used for elementary studies in the subjects Swedish, mathematics and English. In the beginning of a course, information is collected about the course participants' background, reasons for studying, etc. After that the instructional process is studied. This takes place through continuous course evaluation, questionnaires to the teachers, and interviews with the teachers and course participants. At the same time, there is a follow-up of the course participants who interupt their studies.

12 Main findings

232

The investigation in English was started during the autumn term, 1973. So far, no reports from the project have been published. On the other hand, a number of information papers have been published, where the results concerning the collected information have been reported. Among the results so far, some can be mentioned concerning the participating group of students. 1 126 participants who started studies in English during the autumn term, 1973, and the spring term, 1974, have avawered the so-called background questionnaire. This consists of 89 % of all of the participants who were participating in the instruction at the time information was collected, that is, about three weeks after the term started.

## The results show

- that 3/4 ths of the participants are women
- that the mean age of the participants is c. 40 years
- that c. 60 % had previously had 6-7 or 8 years of elementary school studies
- that approximately 60 % are working full-time as well as studying
- that the most usual reason that they have started to study at the adult upper secondary school is to get more general education
- that most haven't studied at an adult upper secondary school before, and that most are only studying one subject

The purpose of the applied promethods in teacher training.	ject phase has been to develop and evaluate
	•

#### 11 Methods

The first phase has embraced

- Collection of observation data on teacher and pupil activities through videoand audio-recordings of 10 lessons in 80 classes, grade 6
- Collection of data on teacher and pupil characteristics
- Assessment of teaching products (pupil achievement, attitudes, school adjustment)
- Development of schedules for analysis of observational data
- Analyses related to the problems of the study.

In one experiment in the practical project phase, student teachers have been trained by microteaching methods in teaching techniques which teachers according to the observations usually do not master, such as techniques for stimulating the verbal interaction. It another experiment, student teachers have participated in a training programme in which individualization, co-operative planning, interest areas, early vocational focusing and field experience are guiding principles.

### 12 Main findings

237

The results from the descriptive and analytical studies revealed rather striking discrepancies between curriculum expectations and actual practice. Lecturing to the whole class is dominant. A typical pattern is that the teacher is talking and the pupils are listening. Another is that the teacher gives directions and the pupils follow them without much discussion. Communication between teacher and pupil is thus most often one-way rather than dialogue and active paticipation from the pupil. Verbal discourse in the classroom typically takes place on the level of fact exchange. Communication on this level occurs ten times as often as verbal interaction on a higher cognitive level meaning discussion, motivation, interpretation, conclusion or evaluation. Other curriculum expectations which are met to a relatively little extent are individualization and small group work. Among the curriculum goals, personality development and pupil guidance play a major role, but the observations reflect a strong emphasis on intellectual goals: knowledge and skills. Discussions about interests, values, emotions and attitudes towards school and society issues have rather rarely been observed. Similar deviations between expectations and observed reality have been found with regard to the teaching process for slow learners. The process in these classes was very similar in most respects that observed in ordinary classes.

9 Background, aims and problem

The Swedish testing and adaptation of minicourse 1: Effective questioning as part of an international transfer project was carried out at the request of the Swedish National Board of Education and the Swedish Ministry of Education. The transfer project was promoted by OECD/CERI with the following objectives:

- to adapt teacher training systems for use in member countries of the OECD
- to test the adapted minicourses and to compare with existing data
- to study and document the problems involved in transfer

The objectives of the Swedish experiment was also

- to adapt and produce a learning system (minicourse) to be used in Swedish teacher training
- to test the learning effects of a minicourse in teacher training
- to point up the mractical pre-requisites for a more general use of the minicourse as a teaching aid in teacher training
- to study the transfer process in connection with the Swedish development of teaching aids

10 Scope

teaching aids

The testing of the minicourse took place during the autumn term in 1973 with 32 student teachers on their practice term. Different grade levels were represented.

A control group of 10 student teachers was included. The minicourse project has close connection to and is a part of the DPA project.

- to study the transfer process in connection with the Swedish development of

#### 11 Methods

Pre- and post-testing was made by means of portable TV equipments. 20 minutes of a discussion lesson were recorded with each minicourse student teacher. The recordings were made in conjunction with the beginning and the end of the course, i.e. with five weeks interval. The same kind of recordings were made with the control student teachers with the same time interval. The recordings were analysed by trainde observers by means of special observation forms. t-tests and covariance analyses were made. A short questio naire was given to the experiment group.

#### 12 Main findings

The following main hypotheses were set forth:

a) The minicourse skills will be used to a greater extent after the course b) There will be no difference on the whole between pre- and post-recordings in the control group

c) There will be no difference on the whole between student teachers at different grade levels in mastering the minicourse skills

Hypotheses b) and c) were confirmed. As for a) there was an obvious change in more than half of the twelwe minicourse skills, while the rest of the skills in most cases showed tendencies in expected direction. The inquiry which was answered by the student teachers on completing the course showed that the minicourse as a contribution to teacher training has met with an extraordinarily positive response.

The minicourse Effective questioning can likely be seen as a very well motivated contribution to Swedish teacher training.

Ser. 229.4. 1972 600 ex SÖ-tryck

Analysis of curricula and other official documents in order to determine society's intentions with regard to its teacher training. Different kinds of tests and questionnaires constructed on the basis of this analysis of objectives are employed. Further development of methods for goal and process analysis, and for construction of theoretical models for the study of training systems are also major tasks in this study.

12 Main-findings

241

In a final report No 1, Erasmie, T & Marklund, S: The training of secondary school teachers in Sweden, main results have been reported focusing on three aspects of the training program: Educational Psychology, Methodology and Practice Training. In this report a number of recommendations has been formulated.

9 Background, aims and problem		
The present study is aimed at a study of social psychology:	the following two questions in terms of	
1. What factors do most to influence the	teacher's total attitudes towards in-	

- service teacher training?
- 2. What changes in the content and desing of compulsory in-service teacher training are most urgently needed in terms of social psychology?

The study is also aimed at developing and testing planning models and at putting forward practical proposals based on the findings made.

#### 10 Scope

The investigation includes about 200 school administrators, headteachers and teachers from all three stages of the comprehensive school.

- Task 1. Study of factors in teacher attitudes towards in-service training activities.

  The collection of data has been based on the interview method. Generally speaking the questions are concerned with the content of in-service training, its organization and its methodological design.
- Task 2. Development and application of planning models.

Studies concerning the demands of the society and the needs of the individual. Inventory of existing plans and draft models.

Development of planning models.

From these analyses and the main findings on sub-task 1 model proposals will be developed. The practical testing of the models will be limited to one or two specific in-service training projects.

#### 12 Main findings

A preliminary report of the first part of the study will be forthcoming in the autumn of 1974.

9 Background, aims and problem

The study of the significance of personality variables for the individual's perception and evaluation of his own video-recorded behaviors under various experimental conditions follows up a self-confrontation experiment carried out in 1968 and 1969 at the Malmö School of Education. The purpose of this follow-up project is to study whether and to what extent the personality variables included in a group test battery influence the perception and evaluation of a person's own video-recorded behavior. On the basis of the results and experiences obtained from this investigation, a detailed research program will be drawn up for the development of suitable test instruments and the mapping of the effect of various personality variables on self-confrontation processes. Being able to see and assess one's own behavior in video-recorded situations has proved to be one of the most important factors in connection with training programs and therapeutic treatment. However, the reason why self-confrontation via internal television and videorecording is so important for behavioral changes and the question of which behaviors are most affected remain to be studied systematically and under laboratory conditions.

Student teachers (grades 4-6, 2nd term of course, spring term 1969 and spring term 1970), a total of 96 subjects. Pupils of MSE's experiment and demonstration school, grade 4, approx. 360 pupils, one tutor and three educational experts panel).

Starting from the experimental plan and measuring instruments described above, the following analysis techniques will not be used:

- 1. Estimations of reliability (e.g. Cronbach's Alfa; Guttman's lower limit)
- 2. Multivariate analysis of variance
- 3. Multiple discriminant analysis
- 4. Multiple correlation analysis
- 5. Canonical correlation analysis

#### 12 Main findings

The analysis programs described in points 1-3 above have been carried out. The analysis of results and reporting, together with points 4 and 5 remain.

10 Scope		

The data collection methods used have been self-observation of the critical incident type and interviews. The information material has been analysed for content and assessed. Information saturation has been checked. In the assessment phase, data were collected by means of questionnaires. The questionnaire material has been assessed from five aspects, namely occurence, training need, length of time, present and future.

### 12 Main findings

251

Problem situations with high values in all five aspects concern training needs as a result of the rapid advance in technology, welfare tasks, heterogeneous student groups and continuous intake.

Education in Teacher Training Based on Job Analysis of Teachers (Project PIL)

The teaching profession investigated by means of analyses of official documents such as curricula, interviews with different "contact groups" of the teacher, critical-incident studies and an extensive questionnaire to school-leaders and teacher-trainers. In these studies the demands and expectations made on the teacher are studied. Different aspects of the new teacher roles are observed systematically. Programs within the areas of pupil care, role playing, cooperation and evaluation are carried out in contact with several Schools of Education. Inventories of teaching aids (printed material and films) are constructed and evaluated in relation to further needs.

12 Main findings

255

The teaching profession can be described in a factorial structure of five "occupational functions", described in relation to

- a) the social and emotional development of the pupils
- b) the cognitive development of the pupils
- c) method and material
- d) cooperation and communication
- e) development work

Different groups of people as well as different official documents stress different aspects of the teacher's job. The two functions considered most important by most of the respondents and not satisfactorily dealt with in the training of teachers concern the social and emotional development of the pupils and cooperation and communication within the school. New patterns of the teacher's tasks are dealt with in a special study.

- I. Teacher-trainers have noted their priorities with fixed frequencies in proposals for programmes drawn up by experts for the various subjects and school levels. The results have been made available to CCTV Production Units to be used as the basis for programme production.
- II. A study is being made of the subjects' attitudes to the various uses of CCTV in teacher training. A comparison is also being made in certain cases of teaching (observation, visits to classes, etc.) with and without CCTV.
- III. The main objects of study are the inter- and intra- reliability of assessments. The validity aspects are also dealt with in certain sectors.

### 12 Main findings

# 257

- 1. The student teachers find pedagogics and methods more meaningful and better integrated with practice when illustrated by means of CCTV.
- 2. CCTV-observations are considered better than or as good as direct classroom observations by more than 50% of the student teachers.
- 3. Microteaching is highly appreciated by teacher-candidates, and makes them more confident when first attempting teaching-exercizes in the classroom. A questionnaire constructed by the project to uncover those in need of microteaching, has proved to be very reliable. A number of different administrative forms have been tried in order to incorporate microteaching as a regular part of teacher training. None of the forms have shown themselves to be entirely satisfactory. New solutions are currently being tried out.
- 4. Subjective judgements in teacher training at entrance interviews and judgements of teacher-competence are not very reliable, which among other things-leads to certain weaknesses in their validity.

The project has been prompted by the new teacher training inaugurated in the autumn term 1968. The investigation is aimed at a continuous qualitative evaluation of the class-teacher training systems of the schools of education. The principal aim of the project is to ascertain the extent to which the various teacher training establishments attain the objectives of the curricula and to identify factors in the teacher training system which facilitate or impede the attainment of those objectives. The evaluation mainly comprises aims and process analyses and is designed to provide a description of the social system of the schools of education. The project is also simed at the development of methods for the study of educational systems.

Analysis of ourricula and other official publications in order to study the objectives of class-teacher training. Questionnaire and interview investigations to study aims, resources and processes at individual echools of education. Knowledge tests in certain central subjects designed in connection with the analysis of aims. Further development of methods of process analysis and the construction of theoretical models for the study of training systems.

### 12 Main findings

259

The project has described those reforme in the area of teacher training which provide the background to its activities. In connection with this, a presentation of the project's aim and form has been made (Marklund, 1972).

A general presentation of class-teacher trainees' evaluations of goals and processes in their education (after 3 terms of training) was made as grounds for a discussion on the content and form of class-teacher training program. The presentation is descriptive and based on only half of the answers received (Linné, Björklund, Haglund, Håkanson, 1972).

The project has outlined a preliminary suggestion of a model which could be used for the evaluation of proficiency and instruction in English for class-teacher trainees (Häkanson and Gärdmark, 1972).

The teacher candidates' social background and view of teacher training at the admission to the schools of education has been described (Linné and Unneback, 1973).

Principale and directors of studies at the schools of education have given their view of teacher training (Björklund, Håkanson, Linné, 1973).

An intensive study has been made at two schools of education. Ite results strengthens the tendencies found at the queetionnaire studies (Hākanson, Jiveskog,

The teacher candidates' experiences during practice-teaching have been analysed (Håkanson and Wikander, 1973).

The teacher candidates' view of teacher education at the beginning and at the end of their training as well as the teacher trainers' opinions on teacher education are to be published shortly.

The main findings of the project have been summarised in School Research Newsletter 1974:8.

Background, aims and problem

The Swedish pre-school is presently experiencing rapid changes with respect to both type of activity and the numbers affected by it. If the changes suggested in the 1968 Commission on Pre-Schools are to be effected, new demands are placed on pre-school teacher training.

The FRU-Project uses as its points of departure the developmental work carried out in the Preschool Project at Gothemburg, which underlined the role of pre-achool personnel in a dialogical-pedagogical method, and the experiences of KUL-K Project at Stockholm, gained from evaluating class-teacher training in Sweden.

The purposes of the project are:

- to study in detail the actual content of instruction used in pre-school teacher training, its dimensions in relation to the new demands placed upon the pre-school, and
- to further develop and concretize such methods and ways of working which are to become important in connection with a reform of the pre-school.

9 Background, aims and p	roblem

The Swedish pre-school is presently experiencing rapid changes with respect to both type of activity and the numbers affected by it. If the changes suggested in the 1968 Commission on Pre-Schools are to be effected, new demands are placed on pre-school teacher training.

The FRU-Project uses as its points of departure the developmental work carried out in the Preschool Project at Gothemburg, which underlined the role of pre-school personnel in a dialogical-pedagogical method, and the experiences of KUL-K Project at Stockholm, gained from evaluating class-teacher training in Sweden.

The purposes of the project are:

- to study in detail the actual content of instruction used in pre-school teacher training,
   its dimensions in relation to the new demands placed upon the pre-school, and
- to further develop and concretize such methods and ways of working which are to become important in connection with a reform of the pre-school.

10 Scope

Pre-school teacher training, pre-school teacher training institutions

74

The project expects to carry out its work after the following time schedule. 1973/74 1975/76

1974/75

1976/77

Descriptive Phase

### ... Process Analysis

#### ... Action Phase

#### ... Reporting

The descriptive phase entailed a survey of the theoretical points of departure presented in report form during the Spring Term, 1974. During this term we have tried to illustrate the practical circumstances under which pre-school teacher training is carried out. This was undertaken by observing activities at Pre-School Teacher Training Centers in Gothemburg and Stockholm (primarily the 1st and last terms). Informal interviews were made with teachercandidates, teachers, principals, and other personnel. Meetings of various administrative organs were also observed. In addition the teacher-candidates kept diaries over certain activities during practice-teaching.

The theoretical considerations made from the literature survey and the results of the pilot study will form the basis of the process-analytical study. In this study the effect of various dimensions will be more closely studied and illustrated. According to plan, the lastnamed phase of the project will develop into an action phase, where the purpose is to make members of the system aware of problems in education in order to, with their co-operation work out and test alternative measures.

The questionnaire was chosen at the method of investigation, as the interview method would have been too costly. The questionnaire was given a relatively broad form. The types of questions and the statements in the questionnaire thus vary. At times, statements, where the teachers could indicate their agreement, doubt or disagreement, were considered to be best.

On other occasions, the teachers have had to choose between fixed alternatives. All questionnaire answers are reported in a supplement.

## 12 Main findings

263

The teachers of adult education are well educated. Most teachers (80 %) have an academic degree, and are accredited teachers of academic subjects.

On the whole, physical working conditions are experienced as being satisfactory. However, certain lacks are reported: Approximately half of the teachers lack a room of their own to work in, and just as many feel that there are too few group rooms for the students.

Most of the teachers (70%) feel that the work of planning is more demanding at the adult upper secondary school, compared with the schools for youth education. The majority of the teachers of adults point out that the numbers of weekly hours devoted to their subject are too few. At the same time, they consider the studying pace for most of the adult students to be much too high. The teachers of adults point out that the relative system of marking is difficult to apply (70%), and that it isn't always possible to give fair marks.

Over 90 % of the teachers of adults are of the opinion that their working conditions are very insecure. But 97 % of the teachers say that they enjoy teaching adults and wouldn't want to give up their jobs.

9 Background, aims and problem

The purpose of this project has been to develop and analyse a teaching and working procedure in which the teacher acts as a guide "meeting" the students on their own ground with regard to knowledge, insight and skills, and in which the students are encouraged to adopt an attitude of active responsibility for their own studies. Another fundamental aim has been to evolve conditions that are conductive to active contact between students and teachers and between the students themselves. The project has been described in two stages. The object of the first stage was to design suitable working methods. The purpose of the second stage was to evaluate these working methods. The working group model proposed in the general report of the UPU project was taken as the point of departure for this work.

10 Scope

Autumn term 1971, experiments with two working groups of 8 students each. Autumn term 1972, experiments with four working groups of 8 students each. Control groups totalling 60 students.

iv scope

Autumn term 1971, experiments with two working groups of 8 students each. Autumn term 1972, experiments with four working groups of 8 students each. Control groups totalling 60 students.

11 Methods

The main experiment comprised the practical conduct of an experiment with guided working groups. This experiment involved all the subsidiary courses making up an elementary course of pedagogics. Two types of control groups were studied. Data were collected by means of a series of questionnaires administered at different junctures, informal conversations and observations recorded in the tutors' logbooks and also by means of three types of tests: the regular examinations, a general test at the end of the term and study proficiency tests at the beginning and end of term.

## 12 Main findings

266

The comparison with the control groups revealed among other things that the members of the working groups

- obtained equal results in the ordinary examinations
- did somewhat better in a general terminal examination focussing on long-term retention
- had improved their study proficiency to a greater extent
- had obtained more numerous and deeper contacts with other students and with teachers.

The analysis of experiences gained during the experiment also showed the need for congruence between studies and examinations. Active responsibility for one's own studies, as evince by demands for meaningfulness and relevance, is counteracted by an examination system in which the students are at the mercy of an arbitrary examiner.

9 Background, aims and problem

The project attempts to illuminate three issues. We mention these in the following order as we mean that the answer to one question comprises a basis for the answering of another of the questions.

- 1. How can knowledge (i.e. what is learnt) be observed and described in a fruitful way
- 2. How can learning skills be observed and described at a functional level
- 3. How can learning skills be influenced

These questions are placed in a certain context - university studies. The subjects chosen are characterized by a type of learning which in-volves working with relatively broad verbal material.

10 Scope

During the project's first two years two large data collections have taken place. The first one included 30 students of education and the second one 30 social science students. Supplementary studies have also been carried out and experimental studies attempting to influence learning skills have been planned.

ERIC

#### 11 Methods

The main body of data is obtained through interviews of the subjects. The interviews are tape-recorded and later written out. The transcriptions are usually about 100 pages per subject and comprise the projects main material. The interviews focus on learning of text materials and the subjects answer various types of questions concerning the content of the material and also make retrospective observations of the learning and recounting process s. In the interviews the subjects also discuss their normal study method. Examination marks comprise further cupplementary data. The data analysis will mainly be carried out at the individual level, that is aiming at describing and comparing the individuals as whole units (comparisons between individuals considering the characteristic patterns within the individuals). The analysis and interpretation of verbal information is a large methodological problem. The planned experiments to influence learning skills will include experiments with influence via instruction, via the material and via the text questions posed.

## 12 Main findings

No results relating to the central issues have as yet been published. However, if the goals (see point 9) are at least partially reached we should recieve a better foundation for taking a stand on vitally important questions concerned with post secondary school education like:

- 1. Goal descriptions
- 2. What is really tested by different types of examination
- 3. The relative distribution of independent versus organised studies
- 4. Advice to the students on study methods

The main results of the project will be presented in three monographies and ten reports. We are currently working on these.

#### 13 Bibliographic information

The project has up to now published ten reports issued within a report series of the Institute for Educational Research.

- 1. Marton, F och Svensson, L.: Vad säger oss det som sägs. (Bidrag till Nordiskt symposium om metodologiska problem inom pedagogisk forskning, Hurdal 26-28 oktober, 1970.) 1970, 17 s.

#### 9 Background, aims and problem

The project is a continuation of the TIPS-project (Applied Psychology of Learning and Learning Skills) carried on earlier.

Background: The opinion that learning both as process and outcome can be described in terms of the relationship between the sign and what is signified. Depending on whether the individual's attention is directed towards the sign or towards what is signified, qualitative differences occur in the outcome of learning. These differences constitute indications of different degrees of comprehension of what should be learned and influence the retention of what is learned.

Purposa: To study the outcome spaces (se Methods) for basic economic concepts and the conditions for directing the activities of the learner in such a way that the attention mainly is concentrated on what is signified. The effects of this directing is analysed in order to discover qualitative differences.

10 Scope

differences.

Students in political economy are to be used as experimental group. About 30 individuals are to be studied intensively and about 100 extensively.

Earlier tested methods will be used, i.e. verbal interviews and questionings of the subjects. Here important than use of statistical characteristics is the analysis of the subjects' answers to a task, i.e. the total variation of answers appearing in a group of students given a certain task, that leads to a description of the outcome space of the task. It is often possible to recognize a hierarchy of levels within the outcome space referring to the contence of information in the subjects' statements and its relation to the "best" answer.

## 12 Main findings

The most essential concequences of the project is that experiments are performed to study learning in such a way that the results could be used in teaching practice.

An analysis of the teacher role in some teaching situations on

9 Background, aims and problem

The aim of this project is to analyse the teacher role in a number of teaching situations, using the current university organization as a frame of reference. The structure of the teacher role is related to various organizational changes and different teaching and working procedures. The analysis includes an integrated view of the teacher's total occupational situation studied from a social psychological approach.

of as to pr	The aim of this project is to analyse the teacher role in a number of teaching situations, using the current university organization as a frame of reference. The structure of the teacher role is related to various organizational changes and different teaching and working procedures. The analysis includes an integrated view of the teacher's total occupational situation studied from a social psychological approach.

#### 11 Methods

The results are examined from empirical research about such factors that are relevant for the study. Such empirical research is for example, how great is the estimated importance of education for future income, how great importance has the technical progress in this context.

On the basis of empirical research a model will be built that makes it possible to examine the simultaneous effects of the relevant factors. After that the importance of other factors will be discussed. Finally the model and its applicability will be discussed.

## 12 Main findings

The main result is that the time sequence of the optimal allocation between work and education is dependent of many factors. The main factors are the rapidity of the technical progress, the personal qualities of the individual and how the education is financed.

For jobs where the technical progress is very fast it is shown that it is important with much recurrent education. Then it is important that there are possibilities for such activities in those jobs.

For jobs where the technical progress is slow, recurrent education is not so important. This has to be taken into consideration in a work-education system. The personal qualities of the individuals play an important role. If equality in income is to be attained, it would require much more education to those with poor personal qualities than to those with good personal qualities. But this is conflicting with equality of opportunity.

9 Background, aims and problem

The present project is a result of the need to know how students aquire the problem solving skills which the instruction aims to communicate. The general aim of this project is to investigate the possibility of increasing the students' ability to solve problems of the type which occurs within the subjects Mathematics and Statistics. The project intends to deal with two questions, the first of which is considered a prerequisite to dealing with the second. 1) In what way are the students' knowledge of statistics and their technique in solving statistical problems related to their abilities in solving such problems? 2) In what way can the students' ability to actively utilize their knowledge of statistics be increased?

10 Scope

ERIC Full Text Provided by ERIC

- 11 Methods
  - 1. An analysis of students' answers in statistical tests in terms of deficiencies in knowledge and problem solving technique has been carried out. Errors made in the test has been categorized in a codingsystem.
  - 2. Students are asked to think aloud when they are solving statistical problems. With the resulting protocols it is possible to follow the problem-solving process step-by-step. This ought to make it possible to study the difficulties of the student in greater detail.
  - 3. Individual students are trained in solving statistical problems with the help of some general rules for solving statistical problems which have been worked out on the basis of previous experiences in the project. Here the problem is to find a suitable way to formulate the rules and a suitable way of teaching the rules to the students.
  - 4. Experiences gained in the project are put together and one group of students, or more, are taught with the help of these rules. Evaluation of the result is done by looking at the difference in result between the groups taught with the rule-and the groups taught without the rules.

## 12 Main findings

Answers from 4 tests in statistics from 19 students have been analyzed. The errors were categorized with the help of a coding-system. The most common errors turned out to be: calculating mistakes (26%), wrong method (22%), using wrong values in formula (13%), wrong structure of formula (12%), and misunderstanding of the problem (9%). The correlations between the coding-categories were low. No difference in the distribution of categories between bad and good problemsolvers could be shown, the differences between individuals consisting mainly in the amount of mistakes made.

Two groups of 100 students each are studied. One (E) consists of students referred to psychological counselling (enlarged educational guidance) because of delayed or no study progess in 1956 to 1959. The other (K) is a random selection of students at the same university, matriculated at the same time as the E group. E group students answered a mailed questionnaire regarding their study and vocational situation in 1961 and 1962. The two groups are followed up with respect to their vocational situation in the first half of 1972.

Comparisons will be made between the counselling group (E) and the control group (K) in terms of certain basic data, interrupted study, examinations, vocational careers, as far as such data are registered. The investigation focuses primarily on students planning a teaching career (the majority belonged to the Faculty of Liberal Arts and Sciences), and on those who have been advised to leave the university or take up a different course of study.

10 Scope

In the E group about 50 variables are recorded, and in the K group about 20. The interrelationship between the variables and the relationship between these and data from previous investigations are studied CMA

Karl Henrik Eriksson

The counselling was given at a psychological institution in co-operation with physician, psychiatrist, and employment service personnel. It was non-directiv, in general accordance with ideas expressed by Carl Rogers. All students went through a personality test battery which was mainly diagnostic. A mailed inquiry concerning study results, career plans, attitudes towards counselling, etc, was administered some years after the counselling.

Data on the further career of the students have been collected during the first half of 1972

## Main findings

The main findings are expected to answer questions about the careers of students who have, at a certain stage, experienced study difficulties and who have been referred to voluntary counselling.

The material has been interpreted and analysed along two main lines. tative by means of methods of multivariate analysis, factor analysis, step-wise regression analysis and latent profile analysis, one qualitative with an analysis of given psychological reports in hermeneutically influenced models

The purpose of the project is to investigate methods of instruction which could be labeled client-related supervision. In focus are situations which basically involve three persons, namely supervisor, student and client. This kind of instruction is part of the graduate education of psychologists, physicians, dentists, physiotherapists, and social workers. The aim of the project is to collect knowledge and empirical findings from these various disciplines about supervisory situations, to compare the different findings, and, if possible, to indicate common components in them. A further purpose is to formulate some general and specific advice that is applicable in situations with client-related supervision.

Questionnaires to some hundred supervisors in different schools. - An intensive study conducted at one of the departments of the dental school. - Development and try-out of a method for teaching skills in how to relate to the client.

8 Keywords	
University production, factor	substitution, university administrating
9 Background, aims and problem	

The aim of the project is to empirically estimate a simple production function for the Swedish university's productive output. Productive output is taken to mean undergraduate education, graduate education, basic research, applied research, and other activity undertaken by the university. Particular attention is devoted to examining the way in which different factors of production can be substituted within the production structure. Attention is also devoted to determining to what degree the necessary (marginal) conditions for productive efficiency are satisfied. A natural question in this respect is whether the institutional decision-making structure of the university facilitates or hinders a rational (effective) production planning.

Production and productivity in the Swedish university system

Completed

X in progress

4 Project - and investigation leader

Professor Ingemar Stahl

Economics Department, University of Lund

Institute -

The method to be used is based on traditional economic theory and involves the empirical estimation of the parameters of a production function. Present plans are to obtain data through an intensive investigation of certain, prechosen subjects and possibly of "utbildningslinjer" (= fixed course plans for entire "fil.kand." degrees).

## 12 Main findings

The significance of the project for future educational planning is based on the fact that it will yield information about production conditions and about the determination of elasticities of substitution among the factors used as inputs in education. It is expected that this will be of importance for p. ning the future subject matter and organization of an expanded university system. Questions which the study should shed light on are: "to what extent should future education be restricted to a small number of geographical centers?", and "to what extent can lecturing time be replaced with increased student time in the home?", etc. Similar research has been conducted in other countries and literature is available on this area. This type of research, including empirical production function estimations, has not previously been conducted in Sweden. The project will be conducted in close contact with other educational research and the results should together be useful for planning the future educational policy in Sweden. Further, SCB will be kept notified of the results

390

of the study in order to improve the gathering of educational statistics. Bibliographic information

#### 12 Main findings.

Restrictions in the social situation for adults and the social structure in the society defines the range of the effect and functions of the above mentioned communication strategies; the needs of the adult student cannot be satisfied with pure information about education and labour market. It is also necessary to develop forms of counselling, both individual contacts and group contacts, in which the adult can clarify the information need, the expectations etc.

9 Background, aims and problem

The purpose of this project is to study research, and above all the decision making and administration connected with research, in the context of the general social system presented by a university. The emphasis is on an analysis of different models of decision making connected with research (e.g. the vertical-bureaucratic model vs. the horizontal-collegial one). Another aim is to study the question of the "connection" between research and basic education, which has been the focal point ofndiscussions concerning the proposals of the U 68 Commission. The ultimate aim is to propose forms of decision making and administration for research and research education that can provide a foundation for considerations regarding the element of research contact in basic education and the organization of research itself.

at university

#### 11 Methods

- 1. Studies of literature on the subject, among other things in order to appraise the analysis of the "academic nuclear system" that has been carried out by Talcott Parsons. Studies of the conditions of research and of factors which stimulate or inhibit creativity within the sector, e.g. those by Ben-David, James March and Baldridge, have also been very useful. The Carnegie Commission on Higher Education has published a number of reports which are relevant to this problem area.
- 2. In July 1973 and July 1974 the project leader attended two international seminars in Aspen, Colorado, on the subject of higher education. These seminars, which were lead by James A. Perkins, have produced a number of reports, to which the project leader has contributed. One of the main themes themes at the 1974 seminar was that of "autonomy versus accountability;" which provided an opportunity of detailed discussions as to the type of autonomy involved and the degree to which it is appropriate to university research.

#### 12 Main findings

A collation of the analyses which were carried out is in the course of preparation, and it is therefore too early to attempt to summarize the findings. It should be said, however, that a wide variety of decision—makingaand administration models are found to be applicable to basic education and research activities at university level.

comprehensive school and to grade 3 in the secondary school. This group has also been studied two years after they left the secondary school. b) One cohort of about 1,000 pupils has been followed from grade 3 to grade 9 in the comprehensive school

and to grade 3 in the secondary school. This is the main group of the 286 project.

11 Methods

BEST COPY AVAILABLE

The research is founded on a model, which is built on the existing theories in the field. The model consists of two steps. The first is a partially unconsious selection of choice alternatives. The second step is the cognitive process of matching one's own capacity and needs with the demands and rewards of the remaining alternatives.

Basic data from the Orebro project are used, and special vocational questionnaires have been issued to the pupils and their parents. Attitudes to different types of education and work have been assessed with an instrument of semantic differential type. In the secondary school special intelligence and creativity measures have also been collected.

#### 12 Main findings

302

The pupils' and their parents' views on educational and vocational choice problems have been described. The attitudes to the choice problems have been related to social background, intelligence and creativity. The role of self evaluation and school satisfaction in educational and vocational choice have been studied.

The importance of social segregation in the class for attitudes to choice problems has also been analysed.

The internal family relations impact on educational and vocational choice and work habits have been studied.

The pupils in the pilot group have answered a questionnaire dealing with their views on their current education and work. These views have been related to earlier data.

# 9 Background, aims and problem

In 1972 The Swedish Board of Education commissioned the Department of Education, Umeå University and Umeå School of Education - Sweden, to develop a test battery for selection to higher education.

The work with the construction of these tests for selection to higher education is aiming at three parallel batteries to be in practice during 1976.

10 Scope

The test battery is possibly to be used on all applicants to higher education

9 Background, aims and problem	

1948 it was considered that educational research in Sweden was in the beginning of its development while it is considered twenty years later in certain countries that swedish educational research is exemplary. This motivates in itself a study of swedish educational research.

The most important aim of the project is to throw light upon the development of educational research in Sweden setting out from Thomas S. Kuhn's theory of "The Structure of Scientific Revolutions".

One head problem is to establish the research traditions (the research tradition) which has been predominant at respectively department during the period.

## 10 Scope

Sweden 1948 - 1971.

The scientific production of every department was established and classified into ten domains of problems. After that representatives of respectively department were asked to pick out investigations representative of how it was considered that research should be prosecuted during a certain period and within a certain domain of problems and to pick out litterature which has been exemplary for how to conduct research during a certain period and within a certain domain of problems. The selection of investigation was analyzed with respect to the basis of knowledge made for the investigation, which problem studied with which purpose, used observations and designs and given recommendations with respect to the results of the investigation. The result of this analysis will be summarized with respect to common - not common traits in the patterns which will be shown by the investigations.

Keywords

Geographic location, Higher education, Northern Educational Region

9 Background, aims and problem

The principal aim of the project is to analyse the northern educational region in order to provide basic material for a total assessment of the local, regional and national effects of changes in the regional supply of higher education. All existing forms of higher education will be studied, regardless of institutional structure. The plan is for the analysis to be based on a number of models of educational structures in the northern educational region.

10 Scope

The project is a case-study of the University of Umea between 1965-1975 and the development of higher education within the Northern crea of Sweden.

12 Main findings

The project is a political science study, which aims to establish certain actual matters of fact and give proposals for conceivable alternatives. The study will be conducted as a theoretical-empirical investigation involving the elaboration and application of political science concepts, suitable for the analysis of this type of organization. The theoretical instruments and the methods of measurement will be described later.

Mathematics, Teaching objectives, Higher education

Background, aims and problem

The mathematics teaching in the gymnasium and the higher technical instituted are in a crises. It is urgent to investigate the role of mathematics as a basis for higher technical education. The objectives for the mathematics teaching ought to be clearly specified and the degree of fulfilment by the present teaching studied.

An analysis will be done concerning the goals for mathematics teaching and the goals spit up into subgoals. The importance of each subgoal for higher technical education is studied using examination papers and textbooks in applied subjects. Interviews and questionaires are arranged with active engineers. The result of the present mathematics teaching is studied using existing tests and examinations at the upper secondary and university level.

9 Background, aims and problem

Models for development of teaching-learning materials are dependent on instructional planning. Thus, the central aim is to gain knowledge about instructional planning.

The intention is to construct a model for instructional planning, which is more characterized of cognitive and holistic perspectives, than the usual technological frame of reference from which the project emanes.

The model is to be used within instructional planning and development of teaching-learning materials. A conversion of the model can be used as an analysis-scheme for constructed materials.

10 Scope

9 Background, aims and problem

Keywords

When a rule or a principle is to be taught, either a discovery method or a direction method is often used. Further, the solving of the practice items of the rule usually involves the giving of the corrects answers, or KOR, to the student. This KOR can either be withheld until all the items are worked through, or the correct answer may be given after each and every one of the items. The former arrangement is here named massed criterion information, and the latter one is named distributed criterion information. Intermediate degrees of massed criterion information may be arranged, of course. The present investigation aims at studying the two variables presnetation of principle information and presentation of criterion information. The main problem

discovery, direction, inductive, deductive, reinforcement, feedback

Which are the learning effects over short time as well as over longer time of firstly, the discovery method versus the direction method. secondly. massed and varying degrees of massed criterion information versus distributed criterion information, and, thirdly the interaction between the two?

10 Scope

The project encompasses a series of three experiments in learningperchology A fourth experiment may be brought through during the spring 1975

The investigation is carried through in classrooms experiments. They are formed according to a two-factor model, and hence analysis of variance is chosen as an appropriate method for treatment of data.

As subjects serve800 pupils in the Swedish elementary school distributed over the three experiments.

The learning material is of an artificial type, making all Ss naive.

12 Main findings

325

The results so far show a clear tendency to interaction between the two variables principle information and criterion information. The largest learning effect is obtained at conditions direction method in combination with either massed (completely) or distributed criterion information and at condition discovey method in combination with intermediate degrees of massed criterion information.

The methods have varied depending on the specific area:

With respect to area (a) the method has been quasi experiments in school classes, in areas (b) and (c) several field experiments and a couple of quasi experiments have been carried out in school, and in areas (d) and (e) the method has been to carry out field studies by means of tests and other instruments

## 12 Main findings

#### 11 Methods

#### ELLIPS I:

Questionnaire regarding factors in the material situation, the knowledge and the attitude after having been presented either a) audiotape with synchronized slides

and printed matter

b) videotape and printed matter

c) self-instructional material

Questionnaire + interview - the medical staff's judgements of and attitudes to the different media.

#### ELLIPS II:

a) Needs analysis - a general method tried out for diabetics. Investigation of the "are" - "ought to" status by collecting and analyzing the existing information material. Studies of investigations and governmental and other decisions regarding diabetics. Interview and questionnaires to diabetics, medical staff, specialists etc. Studies of different hospitals patient information to diabetics.

b) Based on the needs from a) plan, put through and evaluate information situations

for different subgroups among diabetics.

#### ELLIPS III:

Analysis of needs - what criteria should be used to give priority to one disease group in front of an other.

#### 12 Main findings

#### ELLIPS I:

The three audio-visual materials could give the desired learning but the attitudes to TV and film strip were more positive than to the self-instructional material. The contents and the presentation were judged positively irrespective of the instructional material.

The attitudes of the medical staff were very positive towards the instructional material with AV but this was not the case with the self-instructional printed material although it was easy to distribute. The opinion was that it was difficult to get the patient to work with it. The techical equipment was found easy to handle.

Questions usually asked by patients and now dealt with in the instructional material were not asked during the investigation period, but new questions were asked.

#### ELLIPS II a:

Report will come in the autumn of 1974.

10 Scope	

W 4-810-10 ERIO

Denmark and Finland

11 Methods

Analyses of curricula, political consumer goal documents, literature, international policy documents and study material.

Interviews and conferences with representatives of Nordic consumer organizations and school authorities.

Postal questionnaires among teachers, students and parents in Sweden, Norway, Denmark and Finland, on both goals for consumer training and the consumer behavior of the students

Testing a study material prototype in grades 4-6 in Sweden, Norway, Denmark and Finland by means of, among other things, knowledge and attitude tests, student questionnaires, teacher questionnaires and teacher diaries.

#### 12 Main findings

The data collection for the questionnaire study among teachers, students and parents in the four Nordic countries was carried out during the autumn of 1973 and results have not yet been reported.

The testing of study material is planned to take place during the spring of 1975.

Background, aims and problem

Evaluation of instruction can be done from its relation to stated objectives. Results on terminal tests, with the content structured in levels of behavior, will be used as criterion. As predictors the following criteria will be used; variables of talent, result on test of previous knowledge, results on different levels of behavior etc. The purpose is to develop models and methods for evaluation of instruction in terms of a system for objectives and descriptions of content. To these are descriptions of behavior and formative (diagnostic) as well as summative tests related. A theory for the construct content validity and a method for calculation of a measure for the construct is developed. The tests will be a guidence for teachers as well as for pupils as for the relations to methods, means, performances and stated objectives.

10 Scope

Studies of shorter parts of instruction in mathematics and social studies in secondary school. About 1 300 pupils and eight schools. CA

10 Scope Studies of shorter parts of inst dary school. About 1 300 pupils	ruction in mathematics and social studies in secon-

11 Methods

Studies of literature. Seminaries with members of the group of reference. Construction of objectives in terms of descriptions of content and behavior and to the objectives related tests. Calculation of content validity, means, results on the different levels of behavior etc.

## 12 Main findings

The construct "content" have got a more orecise definition. A measure for content validity have been used in a practical situation and got a practical use. The testresults have got a deeper diagnostic and prognostic value when tests - and objective - have been structured in behavioral terms. As an example: The pupils results on items on the different levels of behavior have been related to their results on the whole test and have given informations about where they have their difficulties. The interactions among the levels have also shown that objectiverelated test is a valuable instrument in the process of instruction.
